

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

EXTRACTS FROM LETTERS RECEIVED BY THE
AUTHOR OF "JOINT-METALLISM"

HON. DAVID A. WELLS, LL.D., D.C.L., etc.—Your plan is certainly novel and ingenious.

HON. JOHN E. RUSSELL, Member of Congress from Massachusetts.—The importance of the question you so ably discuss cannot be overestimated.

THE RIGHT HON. LORD PLAYFAIR.—It is certainly a much more honest system of bimetallism than the schemes already propounded.

PROF. W. SMART, LL.D., Glasgow.—It is a most suggestive contribution to a subject which is now creating as much interest in Great Britain as it does in its parent country.

W. T. HARRIS, United States Commissioner of Education.—In my humble opinion the best book on this subject—a subject of vital importance to the prosperity of the people of this country.

RIGHT REV. H. C. POTTER, LL.D., etc.—Much impressed by your argument.

REV. DAVID H. GREER, D.D.—I think your statement of the question most admirable and convincing.

HON. CARROLL D. WRIGHT, United States Commissioner of Labor.—Your theory attracts me very much. It seems to me that there is within it the solution of the difficulty.

PROF. FRANCIS WAYLAND, LL.D., Dean of Yale Law School.—If it has not brought complete conviction to my mind, it has certainly shaken some of my pet beliefs.

JOINT-METALLISM

A PLAN BY WHICH GOLD AND SILVER TOGETHER, AT RATIOS ALWAYS BASED ON THEIR RELATIVE MARKET VALUES, MAY BE MADE THE METALLIC BASIS OF A SOUND, HONEST, SELF-REGULATING, AND PERMANENT CURRENCY, WITHOUT FREQUENT RECOININGS, AND WITHOUT DANGER OF ONE METAL DRIVING OUT THE OTHER

INTRODUCTORY NOTE TO THE FIFTH EDITION.

In this revised edition the statistical tables in the Appendix have been brought down to July 1, 1896, and additional tables, etc., have been introduced.

The Appendix occupies pages 77 to 118 as in previous editions.

Pages 207 to 233, containing Extracts from Saratoga Free-Coinage Debate, Proposed Currency Plank, Letters to the *Springfield Republican*, and After the Election, What ? are added new matter.

NEW YORK, November, 1896.

ADVERTISEMENT OF THE FOURTH EDITION.

The favor with which this book has been received indicates that, notwithstanding the unpromising attitude of parties who are striving to use the currency question for political advantage, the people are studying it, and are seeking some fair and reasonable solution.

This work is based upon original research, and contains pertinent historical and statistical matter, with references to and quotations from the principal authorities on the science of money ; also a complete Index. The statistical tables have been brought down to date of latest report of the Director of the Mint, etc.

The author believes that most of the present depression in trade, agriculture, and other industries is traceable to ignorance of the history and science of money, and to attempts to retry unscientific experiments ; and he opposes both Monometallism and Bimetallism at any fixed empirical ratio. He proposes that the mints be opened to both the precious metals at their market values when they are presented *together* in quantities of equal value, and that joint certificates, payable half in gold and half in silver, be issued by the Treasury, to be legal tender for all debts contracted after a fixed future

date. He claims that the true economic ratio would thus soon be determined, and would then very seldom change, and that debtors and creditors would not be affected by such change, as the actual transactions would be made in Legal-Tender Joint Certificates; and that any possible loss to the Government could be provided against by a small mintage charge.

The treatise presents a convenient plan for coinage and currency on the above basis, with standard silver coins of the same weight as standard gold coins, but takes the ground that details as to the coin to be chosen as the gold standard, the time when and the official by whom the declarations of the Government ratios shall be made, and the periods to be considered in fixing the ratio, are not essential.

The present work shows that the author is a bullionist and opposed to credit money, while believing that credit can attain its greatest just development on a bullionist basis, as it does substantially in England.

NEW YORK, March, 1895.

PREFACE TO THE THIRD EDITION.

The second edition was published on the fifth of this month, and I am informed that it is out of print.

I had planned in the third edition to discuss credit and paper currency at some length. I have not time to do so now, and if I ever undertake this, it will be in a separate volume.

Since the second edition of *Joint-Metallism* went to press, the Government gold reserve has again been reduced below the minimum of one hundred million dollars, as it was evident it would be ; and the President's Message and the Report of the Secretary of the Treasury have been published. I am glad to note that they do not contain any recommendation

viii *Preface to the Third Edition.*

of "coinage on Government account," which was suggested in the Secretary's letter quoted on page 171. But these state papers and the Bill reported by the Committee on Banking and Currency propose what is, in my opinion, a dangerous and unconstitutional system of paper currency, based on general assets, etc.

It is evident that the modern exaggerated theory of credit, of which that very clever barrister and economist, Henry Dunning Macleod, is the most prominent promoter, is threatening the world with general disaster.

Adam Smith has well pointed out how a mistaken theory of wealth caused many European wars during the seventeenth and eighteenth centuries.

Macleod says that Adam Smith, John Stuart Mill, J. B. Say, etc., "had not the faintest conception of the great juridical principles of credit," and that this department of economics he has made his own. He writes: "The true function of credit is to bring into commerce the present values of future profits," and that "Ri-

varol well said, 'Man conquers space by commerce, and time by credit.'"

I regret I have neither time nor space to quote further or to comment fully on this theory, but some of the results of its workings are evident on all sides in bankrupt states, railroads, and speculative companies, and further developments are fast approaching.

It is a remarkable thing in economic literature that Macleod, the apostle of credit money, should now claim to derive support from the writings of Oresme and Copernicus, who were the great champions of sound metallic money, based on the market values of the two precious metals.

If "credit is as good as money," as Macleod says it is, and if Government credit is the best credit, then fiat money is the best money, and the name of Macleod should be exalted in the gate of the Greenbackers.

Believing there is great danger to the community in the seductive theory of credit which Macleod so elaborately and so ably advocates, and which is admittedly

x *Preface to the Third Edition.*

an attempt to discount future profits, or, as he expresses it, "to bring into commerce the present values of future profits," I have added in Part IV. of this edition a short chapter on "The Apotheosis of Credit."

May I ask all readers of Part II. and Part III. to first read the Preface to the Second Edition.

A. P. S.

STOKES BUILDING, NEW YORK,
December 22, 1894.

PREFACE TO THE SECOND EDITION.

The first edition of *Joint-Metallism* consisted largely of letters hurriedly written for the newspapers.

A second edition being called for now, I add, in Part II., commencing page 119, a more thorough presentation of the plan of joint-metallism, with some considerations intended to refute objections, and references to further weighty authorities on the science of money, whose opinions are entitled to especial attention.

On page 5 I suggested some details which might facilitate the establishment of the system here. But these details as to the coin to be selected as the gold standard, the times when and the official by whom the declaration of the Govern-

ment ratio shall be made, and the periods to be considered in fixing this ratio, are, of course, not essential.

In reading very many books on money and coinage, I find :

First. That some of the older writers on this subject far surpass almost all the modern ones in genius, reasoning, force, and clearness.

Second. That, as compared with other sciences, there appears a strange general ignorance of the history of monetary science.

Oresme, the great master of this science in the fourteenth century, was acquainted with the writings on this subject of Justin, Saint Augustine, Cassiodorus, etc.

But Copernicus, the great astronomer and economist of the sixteenth century, was ignorant of Oresme's work in this field, and Bacon, Locke, and Newton, in the seventeenth century, did not know of these writings of Oresme and Copernicus, and the English economic writers of the eighteenth century generally ignored the earlier continental monetary experiences.

Roscher, Professor of Political Economy at Leipsic, when he found a copy of Oresme's work in 1862, supposed that "this diamond of the first water hidden in the dust" had been entirely unknown for many years. Its existence, was, however, known to several French writers, but its importance not appreciated. That this treatise had caused the reform of the French coinage in the fourteenth century was generally forgotten until the publication, in 1864, of Wolowski's¹ *Étude sur le Traité de la Monnaie de Nicole Oresme*, and most recent writers show little knowledge of any of these great authorities, and total ignorance of their most important works.

It appears that at a critical period when it became necessary to reform the coinage, in order to save the country from ruin, some philosopher would adequately study up the matter, and prepare a plan which met the emergency, and then his work was soon forgotten. Old vicious coinage plans would then again be resorted to in order to cheat the people. Again there

¹ Read before the Institute of France August 14, 1862.

would be a crisis in affairs, then another philosopher would save society by monetary reform ; and then his work would, in turn, soon be forgotten.

In Oresme's time the coin had been so debased that it contained only one eighty-sixth part of its nominal quantity of silver ; the late King John, strangely called " The Good," having ordered the masters of the mint to exactly imitate the old coins in base metal, charging them under the most extreme penalty of treason to keep this fraud secret. Oresme discovered and explained why bad money drove out good money.¹

One hundred and sixty years later Copernicus rediscovered how bad money was driving good money out of the great kingdom of Poland, which then embraced Prussia, etc.

Similar conditions of affairs were afterwards repeatedly discovered in England and elsewhere.

Some of the men who brought about great reforms of the coinage were the very greatest philosophers of their time.

¹ See note, page 154.

But, although they convinced those then in authority, their work in monetary reform was not generally understood or appreciated. The hidden but momentous workings of changes in the basis of money are among the things no people have as yet shown an aptitude to understand.

Even to-day the importance of the following simple facts appears difficult of common comprehension, viz. : *That general prosperity in our country depends largely on the prices obtainable abroad for our chief exportable staples ; and that the fall in these is directly caused by the demonetization of silver, because for every pound sterling which a planter in India, etc., receives for cotton or wheat sold in England, he can now employ twice as many native laborers as he could a few years ago, for their wages remain the same in silver coin.*

In a country where monetary questions must be decided finally by popular vote, the importance of a right understanding of the science of money cannot be overestimated ; and its thorough study ought

to appeal to those who have the necessary time and training.

As most of the present depression in trade, agriculture, and other industries is clearly traceable to legislative ignorance of the history of money, and to attempts to retry unscientific experiments, the duty of the hour is to encourage and to facilitate real study of the money problem, which is again about to be discussed in Congress and in the newspapers, and ought not to be decided by ignorance, party spirit, and *ad captandum* appeals.

Anarcharsis criticised the constitution of Athens because the Athenians had wise men to debate and fools to decide.

O happy Athenians ! if you had always wise men to debate !

I do not claim to be learned or wise ; I desire, like Oresme, "to submit what I have written to the correction of wise and prudent men, for, as Aristotle says, the civil needs are often doubtful and uncertain." But I do claim to have made some little study of the currency question, and I desire to study it more, and to see

more general and scientific study of it in our colleges, newspapers, and legislatures, among those who are called upon to lead public opinion. I am sure I will not disoblige these by expressing my humble judgment that the best and most important foundation for this study is Oresme's treatise on the "*Origin, Nature, Law, and Mutations of Money.*"

Professor Roscher well says of this great work :

"In order to rightly comprehend the present state of all science and from this to grasp its future, it is indispensable to know the past, so when we come to climb higher near the unseen sources of some truth, we experience a satisfaction, etc."

His expression loses something in my feeble translation.

In Part III., in this edition, I give some account of Oresme and his work written about 1366, and some notice of the treatise on money written by Copernicus in 1526.

The opening sentence of this latter work I beg permission to translate here :

"However innumerable are the ills

which lead to the fall of kingdoms, principalities, and republics, these four, in my judgment, are the most formidable : discord, mortality, sterility of land, and badness of money. For the first three, the evidence is so apparent that no one can be ignorant of it. But the fourth, concerning money, excepting some men of great ability, very few persons consider or understand it, because it is not by a single blow, but little by little, in an occult manner, that it overthrows the state."

Our country does not suffer from the first three of the above named causes. We are a united people, our death rate is comparatively low, and our land fertile, but we are in danger of bad money.

Of all bad money *fiat* paper money is the worst.

In our legislation we have forgotten the maxims of our Constitution, which made gold and silver the legal tender. We have forgotten the teachings of Oresme, Copernicus, Bacon, Locke, Newton, and a host of other philosophers, that the only honest measure of the value of money is

the value of the bullion in the coin. We have forgotten that all experience has shown that the only way to keep our government currency always safe and good is to permit none to be issued that does not have an equal amount of coin behind it, and that this coin must be always convertible into bullion at a trifling cost.

In the old times the bad money was usually money fraudulently alloyed, because that was the easiest way to take advantage of the popular ignorance of the hidden effects of the money-stamping power. But at times when the governments had large sums to receive, they would cheat by suddenly increasing the amount of silver in the coins, and insisting on being paid in the new coinage. As Macleod expresses it : "When they had debts to pay they cried the coin up. When they had debts to receive they cried the coin down." The mint rates in France were often changed more than a dozen times in a year.

In our times it has been found easier

and more profitable to take advantage of this popular ignorance by reducing the total metallic basis of the currency.

Both these schemes produce bad and dangerous money and cause great injustice and loss to the people.

Five-cent cotton, fifty-cent wheat, low and diminishing gold reserve, the issuing of Government bonds in time of peace, falling wages and decreased employment, these things are making the people think on the currency question. Now is the time for enlightened discussion to find the principles upon which monetary science is bottomed, and to establish our currency on the best and most solid, safe, honest, and permanent basis.

Believing that joint-metallism conveniently provides this basis, I ask for it the candid consideration of competent critics.

A. P. S.

STOKES BUILDING, NEW YORK.
23 November, 1894.

PREFACE TO FIRST EDITION.

The *first* of the following Letters on Joint-Metallism appeared in the *New York Times* February 18, 1894. It was printed also in the *New York Tribune* on the following day, and in the *New York World* February 24, 1894.

The second Letter on Joint-Metallism appeared in the *New York Times* March 26, 1894, and in the *New York Tribune* April 17, 1894.

Editorial articles in the *New York Evening Post* March 30th and April 5th caused the *third* and *fourth* Letters on Joint-Metallism to be addressed to that paper.

Extracts from these Letters, not always fairly representing them, have appeared in various parts of the country, where among the typographical errors may be noted the word "vetoes" being printed "votes," "ratio" printed "ration," "economic" printed "economical," etc.

Numerous inquiries, some of them from those who have seen only part of the correspondence, and the request of Messrs. G. P. Putnam's Sons have led to the present publication.

The *fifth* Letter on Joint-Metallism was not addressed to any newspaper, as it has to be read in connection with the many facts, figures, and statements given in the Appendix.

In the Appendix, among other matters, it may be seen how the admissions of leading monometallists strongly favor Joint-Metallism.

President Cleveland said in his Message March, 29, 1894 :

"I hope a way will present itself in the near future for the adjustment of our monetary affairs in such a comprehensive and conservative manner as will afford to silver its proper place in our currency."

The design of these Letters is to point out such a way.

A. P. S.

STOKES BUILDING, NEW YORK

April 26, 1894

FIRST LETTER ON JOINT-
METALLISM.

JOINT-METALLISM.

FIRST LETTER.

To the Editor of the "New York Times" :

SIR : To make business generally prosperous, it is necessary to find a safe and honest plan by which both gold and silver, permanently and at their relative market values, may be made available as the metallic basis of currency.

For a long period of years the money of the world has been, in total value, about half gold and half silver. Recently some nations have demonetized silver, and other countries have attempted to maintain it at a ratio that did not regard the relative values of the two precious metals. This, at a time when the world's indebtedness has increased to a danger-

ous point, has naturally caused distrust and depression of trade.

The known debts of the world amount to more than eight times the total amount of gold in the world. To incur a debt that must be paid on a gold basis is to sell gold short when the short interest is known to be eight times as great as the total amount of the stock in existence. Large owners of money prefer to keep it in banks or trust companies at 2 per cent. or less interest rather than to use it in the production or purchase of goods or property which must decline in value as the purchasing power of money, based on gold alone, increases. Money is hoarded and enterprise halts, trade languishes, laborers are unemployed, incomes are reduced, and times are hard.

The following plan¹ for joint-metallism would enable both the precious metals to be safely used together, without frequent recoinings and without danger of one metal driving out the other, and would afford an honest, adequate, self-regulating, and permanent basis of currency :

¹ See page 121.

Let there be silver coins containing the same weight of silver as there is weight of gold in the present \$5 gold-piece.¹ Let those silver coins be called standards.² Let it be enacted that for all debts, public or private, of \$10 and upward, contracted after six months from the passage of the act, it shall be lawful to pay half in gold coins and half in such number of standards³ as shall be approximately equal thereto, according to the Government ratio to be fixed as follows :

On the first lawful day of each month,³ after six months from the passage of the act, the Secretary of the Treasury shall declare what number of standards² most nearly represent a \$5 gold-piece, according to the average relative market values of gold and silver, from the first day of the third month after the passage of the act and based on the average market values of all the intervening months. This number is to be the ratio for that current month. A \$5 gold-piece, plus said number of standards,² will constitute \$10 in lawful money during said month.

¹ See page xi.

² Or silver standards.

³ See page 198.

Let the mints be open to the coinage of standards, double standards, triple standards, and pieces containing 1000 standards, when the silver is presented accompanied by an equal value of gold, at the current Government ratio, to be coined into \$5, \$10, and \$20 gold pieces.

Let the Treasury receive deposits of gold coin together with silver standards, the proportion of gold and silver in such deposits being according to the Government ratio current at the time, and issue therefor legal-tender joint certificates in denominations of \$10, \$20, \$100, \$500, and \$1000, these certificates to be redeemable at the Treasury half in gold and half in standards, the number of standards to be according to the Government ratio in force at the time certificates are presented for redemption.

Changes in the Government ratio would become very infrequent, could always be calculated in advance, and would never exceed one standard at any one time. At present value of silver, this would make a difference of 15 cents on \$10 lawful money, or $1\frac{1}{2}$ per cent.

This plan would be a suitable basis for negotiating an international agreement for joint-metallism, with an international committee to make any changes in the ratio ; but, as the plan is to maintain the full use of silver with gold on the basis of their relative market values, the United States, which is most interested, could safely undertake it alone.

The only possible loss would come from a decline in silver, and this is not probable when, under a system permanently binding the two metals together, silver would have substantially the same access as gold to the mints, even in this country alone. A small uniform minting charge of so much per ounce on both gold and silver might provide a fund to meet any possible loss ; and, until an international agreement should be obtained, standards might be coined exclusively of silver mined in the United States after the passage of the act, the market price of all silver to be still used in fixing the ratio.

The Government ratio would soon come to be substantially the economic ratio which is the relative costs of produc-

tion of gold and silver in the poorest mines that could be worked at a profit, when both metals had equal access to the mints. And the cost of production of the two precious metals together would naturally constitute the just and safe limit to the expansion of the currency and be the proper measure of its value.

Owing to some exceptionally rich finds of limited extent, and to enormous expenditures for tunnels, plants, etc., not counted in the present cost of production, a small quantity of silver can be produced below even the present price, but this is equally true of gold and does not fix the cost of production of quantities sufficient to meet the requirements of the currency on a joint-metallic basis.

So long as credits throughout the world were expanding, a limited amount of coin would support a large amount of credit. But when there is danger of one money metal driving out the other, and credits are contracted, a larger quantity of coin is required or panic will result. Then pooling of credits and clearing-house certifi-

cates, etc., may save banks and delay or distribute disaster, but will not produce prosperity.

The sobered sense of the people will make them long refuse to develop business until they are assured of an adequate and permanent supply of currency based on the only possible final basis of a sound and sufficient currency—the two precious metals together, limited by the quantities in existence and the cost of production. This can be obtained by the plan I have called joint-metallism.

EDITORIAL FROM "EVENING
POST."

EDITORIAL ARTICLE IN THE *Evening*
Post OF MARCH 22, 1894.

The most unfortunate feature of the new silver movement started by Gen. Francis A. Walker in Boston is the fact that it gives the rest of the country a false impression as to public sentiment in the East. The silver lunatics of the South and West are not given to fine distinctions, and do not take the trouble to read with discrimination long papers on financial topics. They jump to the conclusion that Walker and some other men whose names are known to them are in favor of silver coinage like themselves, and by another jump decide that this must be the sentiment of New England. This impression is now being given to the people of the South and West by many of the newspapers which publish and comment

upon the Boston outgivings, and it naturally has a marked effect in reviving the financial craze which had begun to abate after the repeal of the silver-purchase act. There is really no ground for the belief that public sentiment in Massachusetts on the silver question is any less sound to-day than it has always been, but it is not strange that the recent developments should deceive people at a distance. This is the most deplorable aspect of the matter.

**SECOND LETTER ON JOINT-
METALLISM.**

JOINT-METALLISM.

SECOND LETTER.

To the Editor of the "New York Times":

The publication of my letter on joint-metallism, which appeared in your issue of February 18th, has brought me numerous criticisms, some entirely favorable, others that think me right, but inopportune, and others that appear not to fully understand the results of the plan I have proposed.

Now that Congress has passed the Seigniorage bill, I again trespass upon your kind hospitality for a few further lines regarding this plan of joint-metallism, by which gold and silver together, at ratios always based on their relative market values, may be made the metallic

basis of currency and afford a sound, honest, self-regulating, and permanent currency on the only possible safe and adequate final basis, the two precious metals *together*, limited by the quantities in existence and by the costs of production.

The new silver coins I have proposed, especially those containing 1000 standards each, would, for the most part, at first, be deposited in the Treasury, together with an equal amount in value of gold coins, the two together forming the appropriate basis for the Government currency issued against them. Whenever more currency should be required, gold and silver together would be taken to the mint and the coined proceeds deposited in the Treasury. Whenever less currency should be required, gold and silver would be together withdrawn from the Treasury and used in the arts, and less would be mined.

As to the present silver dollars and other silver tokens, when the ratio becomes settled and remains unchanged for a considerable period, if the silver dollars and

the smaller silver coins be found then to differ very much from the ratio, they should be recoinced, so as to be made of nearly full intrinsic value.

Prior to 1873 (under "free coinage") for each 500 ounces of pure silver the mint delivered 646 silver dollars, less a charge of $\frac{1}{2}$ cent on each piece. . . \$3.23
and for copper alloy about. 1.11

\$4.34, or
about two thirds of 1 per cent. The coinage of much larger pieces would cost the mint a much smaller fraction of 1 per cent.

That the question of joint-metallism is an intricate one is no reason why it should not be studied, and discussed in the newspapers. That the ratio can only be approximately exact might be urged with equal force against navigation and other sciences.

Until the general public, by special study, is better able to understand questions regarding the basis of currency, it may be injurious to have bimetallism

made a party issue. The debate on bi-metallism is becoming so envenomed that, like the slavery question, it may make dangerous sectional trouble. Many at the East think the West is dishonest on this subject. Many at the West think the East is dishonest on this subject.

The duty of patriotism is to try to find a just and honest way to permanently settle a question which cannot be finally settled by narrow and fluctuating majorities nor by vetoes.

It will go far to promote clear thinking regarding this question if it is generally understood—

First, that money is a certain potentiality or stored-up and readily-available energy representing the cost of the production of the precious metals.

Secondly, that the real function of the mint regarding the precious metals is to stamp pieces of metal so as to indicate the weight of the gold or silver they contain.

Thirdly, that Government paper money should be only certificates of the deposit of such pieces of metal.

Fourthly, that for centuries the metallic money of the world has been in total value about half gold and half silver, a legal ratio having commonly existed between the precious metals, being for a long period $15\frac{1}{2}$ to 1 or 16 to 1, the legal sanction of the ratio being powerful enough to overcome *slight* differences in the relative costs of producing the two metals or their market values.

Fifthly, that silver, having now become generally demonetized, and its chief use in Europe and in the United States being thus abolished, and its market value diminished below the reduction in value caused by the lessening of the cost of production, certain results have necessarily followed, very injurious to our country and to the world, among these results being a general decline in values and an insufficient metallic basis of currency, making manufacture and trade¹ both uncertain and dangerous.

The question before us is how to remonetize silver.

First—Shall the United States alone

¹ And agriculture.

attempt to fix and maintain a permanent ratio under present conditions of a demonetized silver market? This is impossible.

Second—Shall we wait until other nations can be induced to join in fixing a ratio? This is dangerous and unnecessary, and the ratio, if so fixed, would soon have to be changed.

Third—Shall the United States decide to use gold and silver together at ratios always based on their relative market values? This is safe and honest, and it can be accomplished by the plan I have called joint-metallism.

Instead of waiting to make a law or a treaty every time a change in ratio is required to conform approximately to the market values, my contention is that we ought to establish a law now and a treaty, if possible, later, that will provide for necessary changes in ratio, although it is probable that after both metals shall have had about equal access to the mint, even in our country alone, for a period of a year or more, on the joint basis I have proposed, changes in ratio will thereafter

become very infrequent, and perhaps many years may pass without such a change.

A few years ago it became evident to some students of economics and to the Government of Germany that the falling off in gold production and the cheapening of silver production by improved metallurgy, etc., and the increase of the world's business and credits, would make inevitable a change in the ratio, which from the beginning of the century had varied but very little.¹ Germany² took advantage of her knowledge, her financial position, and her governmental methods, which enabled her to act promptly, and sold her silver for gold, and in 1871 and 1873 demonetized silver, and other nations followed her lead. Now that the market value of silver has fallen far below the cost of its production in quantities sufficient for its general use as a money metal, Germany may probably be glad to follow us in joint-metallism on the plan I have proposed, and to congratulate herself on her astute operations in silver.

¹ See page 132.

² M. Rochussen opposes this view.

It may not be necessary to have more money than we now have, but it is necessary to have more security as to the future value of our currency. Business cannot prosper and labor cannot be fully employed if there is danger that a few months hence a dollar, which is the term we use in contracts, may be worth much less or that it may be worth much more, as measured by the market values or cost of production of the precious metals together, which, in view of our Constitution and of all history, is our only fair standard. Daniel Webster said : " I am certainly of opinion that gold and silver, at rates fixed by Congress, constitute the legal standard of values in this country, and that neither Congress nor any State has authority to establish any other standard or to displace this standard."

It is necessary to the security of the creditor that no Government money should be issued, except based on the market value of the precious metals as contemplated in the Constitution, and it is necessary for the security of the debtor that he

A Vein for Silver and a Place for Gold. 25

shall not be subject to the risk of money being made artificially scarce or dear, by laws which may restrict the metallic basis of currency to a single precious metal, the hoarding of which may be promoted by such laws, gold being a metal the production of which cannot be greatly and promptly increased by labor.

The Bible says : " Surely there is a vein for the silver and a place for gold." From the earliest historic times there have been known veins where the supply of silver could be at any time largely and promptly increased. It has been always a question of cost of mining, milling, and smelting. But all great increases in the production of gold have come from new finds, which were generally soon worked out and are less to be expected now that the world has been more explored.

The great difficulty in solving the question of the safe, honest, and proper metallic basis of our currency comes from the want of general, adequate, and impartial study. The newspapers are best able to promote this study, and this alone can

save us from fiat money and from money panics.

It is unfortunately true that in this country of peace and freedom, of abundant land, and unrivalled resources, among a people of general education and unexampled energy, there is to-day much suffering on the part of many able and willing to labor for their daily bread. This suffering is directly traceable to unwise legislation caused by the want of adequate study of economic science.

ANSON PHELPS STOKES.

NEW YORK, March 22, 1894.

**EDITORIALS FROM "EVENING
POST."**

EDITORIAL ARTICLES IN THE *Evening*
Post, OF MARCH 30, 1894.

Mr. Anson Phelps Stokes has a currency plan called "joint-metallism," by which "gold and silver together at ratios always based on their relative market values may be made the metallic basis of currency."

The reason why Mr. Stokes proposes this plan is, he says, that the general demonetization of silver, and the great reduction in its purchasing power, "have caused a general decline in values, and an insufficient metallic basis of currency, making manufacture and trade both uncertain and dangerous."

Now, this central or basal proposition of Mr. Stokes's is totally denied by the monometallists,¹ and that is why they will

¹ See Appendix pages 90, 91, 94, 95.

never consider his plan. They say, with one of the British delegates to the Monetary Conference, that the whole silver movement is simply a preposterous attempt to keep prices up when science, art, invention, discovery are knocking them down ; that the fall in silver has had no more to do with the decline in prices than the fall in wheat, and that nobody has complained or is complaining of any actual scarcity in the supply of gold. It has not shown itself anywhere.

Many dozens of gentlemen in various parts of the world keep telling us that it is going to show itself by and by, and that they are lying awake at night thinking anxiously about it. But there is no sign of it. The supply of gold is increasing rapidly in answer to the increased demand for it,¹ and we believe it may be said with safety, that nobody in any country has ever yet maintained that he was unable to get gold when he had something to exchange for it or good security to borrow it on. In fact, nothing is ever

¹ See Appendix, p. 104.

heard of the scarcity of gold in business circles. All we know about it we get from bimetallic pamphlets and speeches.

The great demand for some other and cheaper kind of currency comes from gentlemen with debts to pay, but if we begin tinkering the currency in order to accommodate these gentlemen, the tinkering will last for ever. The "debtor class" is the oldest class in history, and the hardest to satisfy, and the least interesting. The class which most demands the care of the legislature is the creditor class—that is, the class which has wages to receive, and savings in the bank, and Government bonds in its boxes.

Apropos of this it may be said to the Boston brethren who are sounding the trumpet of alarm over silver, that it is absurd of them to stay in the bimetallic camp. Their central proposition, that Governments by laying their heads together can keep two commodities at equal value, in spite of difference in quantity, in cost of production, and in market

price, applies, though they do not seem to see it, to other commodities than gold and silver. It would apply just as well to copper and gold or copper and leather as silver and gold, and is ample support for the greenback theory.

There is no reason in the world, on this theory, why the Government should not discard metallic money altogether, and agree that certain stamped paper should in their dominions have a certain value in exchange. In old times, when a Government adulterated its coinage—that is, ordered it to pass at a fictitious value—it acknowledged it was cheating, and locked up anybody who said anything about it. The curious feature of the bi-metallic and silver craze is that its victims want the civilized Governments to do this cheating in unison, by common consent, and in the light of day.

The prospect opened to the modern world by this confession of ordinarily sensible and educated men that the Government has this power over currency, it is no exaggeration to call appalling. It

Ammunition of the Most Deadly Kind. 33

is ammunition of the most deadly kind for the socialist, communist, populist, and anarchist, and has the promise and potency of such monetary confusion as has never been seen in any age.

**THIRD LETTER ON JOINT-
METALLISM.**

JOINT-METALLISM.

THIRD LETTER.

To the Editor of the "Evening Post":

SIR: A leading article in last Friday's *Evening Post* beginning "Mr. Anson Phelps Stokes has a currency plan called 'joint-metallism,'" and your following article commencing "Apropos of this," might, I fear, cause some who had not seen my letters on joint-metallism to suppose, mistakenly, that you intended to associate what I have written with the writings of those who desire a dishonest currency, or who you say furnish "ammunition of the most deadly kind for the socialist, communist, populist, and anarchist."

You do not quote the particulars of my plan for "joint-metallism," nor the pro-

vision in it that it shall not affect any debts except those contracted six months after it becomes law. No one can point out any line that I have written that in any way favors dishonesty or anarchy.

What I am contending for is "an honest, adequate, self-regulating and permanent basis of currency," to prevent fiat money, and to find, as I have said, "a just and honest way to permanently settle a question which cannot be finally settled by narrow and fluctuating majorities nor by vetoes."

You say that monometallists totally deny that the demonetization of silver and the great reduction in its purchasing power, etc., have caused a general decline in values, etc., and you refer to British authority.

The Parliamentary Commission on gold and silver which considered substantially this question were equally divided in their report, six members holding to one side and six to the other. Their final report was made in 1888. Since then a distinguished member, among those who then

held that the general demonetization of silver, and the great reduction of its purchasing power, or, in other words, the appreciation of gold, had not caused the general decline in values, has since publicly declared, in 1893, that further study has convinced him that he was in error on this point when he signed the report five years before.¹

I do not object to that reduction in values which comes from science, art, invention, and discovery, but I do object to the unjust enhancement of the value of gold caused by making it the sole money metal and the sole final basis of currency.

The only final basis of all sound currency is precious metal. For centuries the money of the world has been in total value about half gold and half silver. If this final basis be now limited to gold alone, then the final basis is diminished by about one half. Money may then be plenty in banks because enterprise fears to use it, and trade languishes and laborers are unemployed.

¹ See Appendix, page 104.

Even where only one of the precious metals has been in actual general use as money, the fact that both were legally available has been the important fact.

In your issue of March 22d you deprecate the present revival of the silver question in the East, as giving encouragement to "silver lunatics at the South and West."¹ But so long as our Government is based on popular suffrage, free and full discussion of this question is as necessary as it is inevitable.

If there had been more thorough, fair, and impartial discussion of the silver problem, the absurd Sherman act would never have been enacted, and instead of it I think we might have had a law for the use of "gold and silver together at ratios always based on their relative market values."

I do not want dishonest currency, nor have I any favorable regard for anarchy ; but, in company with many more competent students of economics, abroad and here, I hold that an honest and practica-

¹ See page 13.

ble way can be found to permanently restore silver to its historic¹ and just position as a money metal, and that this will be of inestimable benefit to the world, and especially to our country.

Therefore, with all becoming trepidation, standing, as I feel I am, face to face with that greatest of American monometallists, the distinguished author of the World's Fair address on "The Gold Standard," I venture the opinion that the full and temperate discussion of the silver question in the press is most timely and important, and that many who are not monometallists are neither dishonest persons nor lunatics.

ANSON PHELPS STOKES.

NEW YORK, April 4, 1894.

EDITORIAL FROM THE "EVEN-
ING POST."

EDITORIAL ARTICLE IN THE *Evening*
Post, OF APRIL 5TH, 1894.

THE GODDESS ARGENTUM.

We print elsewhere a letter from Mr. Anson Phelps Stokes on his system of "joint-metallism," in reply to some remarks of ours the other day.

Far be it from us to accuse Mr. Stokes of sympathy with dishonesty or anarchism, or of any desire or intention to aid or abet them. Of course it would be silly to do so. But a strict regard for truth compels us to express, as often as the opportunity offers, our solemn conviction that all attempts, whether made in Boston or New York, to persuade the world that the use of silver as full money of account, whether jointly with gold or not, is in any sense a duty of the Govern-

ment, or is called for as a protection for the poor man against "gold-bugs" or "Wall Street sharks," promote populism, communism, anarchism, greenbackism, and simple silverism, and do threaten this country with unnumbered woes.

Nearly all the trouble has arisen out of the personification of silver as a moral being which began in 1877-1878, and of which we find a trace in Mr. Stokes's letter where he speaks of the "historical and just position" of silver.¹ This, if it means anything, means that there is some position in the currency or financial arrangements of the nation, which is due to silver as a matter of right and by prescription, that it can, as an individual or a corporation can, *claim* a place in our medium of exchange, of which we cannot deprive it without a breach of the moral law.

To our minds there has been nothing more extraordinary than this since Moses, on coming down from the mountain, found the Israelities, in spite of the most patent proofs of divine sovereignty, worshipping

¹ See Appendix, page 80.

a golden calf of their own making. It illustrates admirably what to many people now seems incomprehensible, the tendency of the whole ancient world to mythological explanations of the universe. The notion that silver has rights and virtues, that it is courageous and faithful to its friends, and loves the poor, and has made itself an historical place, and is entitled to justice—all of which propositions have been maintained during the last fifteen years by American orators and writers—shows how near we are, in spite of Christianity and science, to the state of mind in which men deified the moon and sun, the mountains, the streams, and even wild beasts and oxen.

To us silver has the same historical position, and has the same rights under the moral law and the United States Constitution,¹ as wheat or leather, wampum or cowries, or coal. There was a time when wheat was twice as dear as it is now, but did it acquire an historic right to be kept at that price, and do we insult it by

¹ See Appendix, page 80.

selling it at 64 to 66 cents a bushel? It has played a more prominent part in the world's history by far than either silver or gold, and ought to have a far higher place in our affections than either. And yet it is bought and sold on margins by Chicago and other speculators, with an indifference to its peace and comfort which is well calculated to excite the indignation of an honest worshipper.

Most other commodities which have played a prominent part in the growth of our civilization have the same story to tell. The march of science has cheapened them, by lessening their value to mankind, but if they are to be worshipped as silver is—that is, treated as moral beings instead of simply brute instruments of human comfort and convenience, we must go back to barbarism. All who know India acknowledge that the sanctity of the cow is in that region a serious hindrance to progress. It cuts the Hindu population off from both beef and a good quality of leather. It sometimes leads, as the other day in Bombay, to riots and murders. It

is, of course, difficult for those who look on the cow as simply an animal which furnishes milk and hides, to avoid occasional displays of irreverence or levity in her presence, and this wounds the Hindu, as our silver-men are wounded by want of respect for silver, in their tenderest part. But what is the remedy? None that we know of except the growth of knowledge and more scientific conceptions of the universe.

Silver is a metal which mankind has found useful as currency in times past, when its value, like the value of nearly all commodities, was pretty steady.¹ Various circumstances, concerning which there is more or less dispute, have deprived it of a good deal of its usefulness as currency, and there is a general disposition among the nations which can afford gold, to discard it.

The one way to meet this tendency is to show that the value of silver is likely to be again steady. To claim for it divine honors or moral rights is simple paganism

¹ See Appendix, pages 94, 110.

and immensely ridiculous. Hides were once wonderfully useful as clothing. Indeed, they were, in northern climates at least, probably the first clothing man put on after his own hide became too tender for exposure. Did this give hides an historic position? Did it give them a claim to justice? Did it make the use of broad-cloth a wrong to them over which the human conscience should reproach itself?

FOURTH LETTER ON JOINT-
METALLISM.

JOINT-METALLISM.

FOURTH LETTER.

To the Editor of the "Evening Post":

SIR: I have read with much interest your courteous and interesting article in yesterday's *Evening Post* on "The Goddess Argentum."

To worship a goddess with so unfeminine a name would be indeed shocking. I am opposed to idolatry, monometallism, and inflation. You say that the monometallists will never consider my plan because they totally deny that the demonetization of silver and the great reduction in its purchasing power have caused a general decline in values, etc.

The following clause in my plan makes it entirely unpalatable to all who want cheap currency to pay their debts with:

“ Let it be enacted that for all debts, public or private, of \$10 and upward, contracted *after six months from the passage of the act,*” etc.

But between the monometallists and the inflationists there is a large class that will finally decide this question—the thrifty common people, who are pretty sure, in time, to get at the right of any ethical question and any ordinary business question. These plain people, the mass of the voters in our country, have no sympathy with dishonest debtors, nor have they any desire to allow creditors any unfair advantage.

They do not quickly grasp financial problems that require special study, but they would sooner understand these problems if an independent press would furnish facts and arguments in a non-partisan and non-sectional spirit, allowing both sides to be fairly heard.

Your fairness in printing views of correspondents that honestly differ from your own, is worthy of all commendation.

It is of these common people that Abra-

ham Lincoln said : " Those whom the Lord prefers, because He has made so many of them " ; and to quote again from Lincoln : " You can fool all of the people some of the time and some of the people all of the time, but you can't fool all of the people all of the time."

They will come to see that it is not for their advantage to have a debased currency, and at the same time they will see that if the final basis of currency be restricted to one kind of article alone, as, for example, city lots or eight-carat diamonds, or ocean steamers, or gold, then capitalists are given an unfair opportunity to monopolize such final basis, and that values of farms and products, wares and merchandise will decline, and business and employment become uncertain.

You say the supply of gold is increasing. For what considerable period of late years has there been any important increase ? Has it increased in proportion to the increase in national debts or the increase in the world's trade and population ?¹

¹ See Appendix, page 90.

A report issued by the Treasury about January 1, 1894, gives the per-capita stocks of money as follows :

France	\$36.81
United States.. ..	26.02
Great Britain.....	20.40
Germany.....	18.56
China.....	1.80

Will not the 400,000,000 of China require more than this now that they are getting railways? You and other eminent American monometallists, as Messrs. Sperry, Bourne, Wells, Laughlin, Atkinson, etc., etc., quote often the statements regarding the production of gold, as compiled by Dr. Soetbeer for the years 1493 to 1885, and as estimated for the years 1886 to 1892 by the Bureau of the Mint. These and other instructive tables are conveniently found at the back of the most orthodox monometallist speech of Hon. Lewis Sperry in the House of Representatives, August 21, 1893.¹

In 1688 the debt of Great Britain was £664,000. It is now £685,000,000. That is, it is more than one thousand times as large as it was in 1688.

¹ See Appendix, page 105, etc.

PRODUCTION OF GOLD IN THE WORLD.¹

Period.	Annual average of period, in fine ounces.	Period.	Annual average of period, in fine ounces.
1851-1855	6,410,324	1886	5,127,750
1856-1860	6,486,262	1887	5,093,984
1861-1865	5,949,582	1888	5,316,412
1866-1870	6,270,086	1889	5,746,950
1871-1875	5,501,014	1890	5,473,631
1876-1880	5,543,110	1891	5,830,107
1881-1885	4,794,755	1892	6,328,272

In 1688 the production of gold was about 346,000 ounces. It was, in 1892, 6,328,272 ounces. That is, it was in 1892 eighteen times as large as it was in 1688.

I think the sober sense of the people will decide that they don't want inflation and that they don't want monometallism, but that they do want to return to a larger use of silver, if it can be arranged for conveniently and honestly, and that this can be accomplished by making the basis of our currency both gold and silver in equal parts, based on market values, and to be legal tender for future debts.

ANSON PHELPS STOKES.

NEW YORK, April 6, 1894.

¹ See Appendix, page 106.

[To make the above table of the gold increase thoroughly comprehensible and pertinent, the diminishing part played by gold in the transactions of life should also be set forth.¹ Less than 5 per cent. of the work of exchange in London and here is now done by gold. Checks were unknown in 1688. If the Chinese or any other people want more money they will get it in the usual way. Bimetallists need not lie awake about it.—ED. *Evening Post.*]

¹ See page 68.

**EDITORIAL FROM THE "EVEN-
ING POST."**

EDITORIAL ARTICLE IN THE *Evening*
Post OF APRIL 17th, 1894.

It was most unfortunate that so many people here at the North believed that the victory of sound currency was completely won when the Sherman law was repealed. The truth was that it left untouched in a large part of the country the great delusions out of which the Sherman law sprang and which it was intended to satisfy. Its repeal was simply a surrender to stern necessity. There was no money in the Treasury to continue the purchases for which it provided. Foremost among these delusions was the belief that the Government can raise or lower the standard of value ; that it is its duty to supply money to the people, and that the bankers and others who refuse to lend it without security are selfish and designing persons, who ought to be taxed into good behavior.

The first duty of intelligent men, when the struggle of last fall was over, was, it seems to us, to engage heart and soul in the great work of public instruction as to the nature and functions of money, and to abstain rigidly, for a while at least, from any words or acts which would be likely to aggravate the prevailing popular errors on this subject—errors more threatening probably to the immediate economical future of the country than any with which we have ever had to contend since the foundation of the government. The appearance of the currency in the political arena was the greatest misfortune which has befallen the nation except the civil war.

FIFTH LETTER ON JOINT-
METALLISM.

JOINT-METALLISM.

FIFTH LETTER.

To the Public :

Referring to my previous letters on Joint-Metallism and to the newspaper criticisms thereon and the suggestions that such discussion of the silver question is injurious at this time, I desire to say, that the danger of the situation does not come from discussion but from the facts and from the want of more thorough, impartial and general discussion.

A Scotch Highland minister, preaching from the text "Can the Ethiopian change his skin, or a leopard his spots?" explained that an Ethiopian was a black man and that a leopard was a spotted man suffering from leprosy.

After the service an English clergyman

tried to kindly explain to the Highlander that he had confused the words leopard and leper.

The reply was : " Avoid criticism It will lead you into all kinds of infidelity."

Some dangers of the present situation.¹

The national debts of the world are now so enormous and increasing so rapidly that if they continue to be extended payable in gold alone, the base will be found insufficient to support the super-structure.

Another danger is the enormous amount of railway bonds² coming due about the beginning of the next century, while one fifth of the total mileage of railways in this country is already being run by receivers under directions of courts which are looking to the interests of the communities and the laborers and refuse to allow wages and some other expenses to be reduced on bankrupt roads.

Another danger, and one that shows the need of promptly settling the currency

¹ See page 141.

² And other bonds.

on a just and permanent basis, is found in the last legal-tender opinion of the United States Supreme Court, 1884.

“Under the power to coin money and regulate its value, Congress may issue coins of the same denomination as those already current by law, but of less intrinsic value than those (as in 1834) by reason of containing a less weight of the precious metals, and thus enable debtors to discharge their debts by the payment of coins of the less real value.”

It is admitted by monometallists that if the Secretary of the Treasury had made a different use of his discretion as to paying out gold and silver, or if the President had made a different use of his veto power, we would now be on a silver basis or rapidly approaching it; and the newspapers daily refer to the great difficulty which the Secretary of the Treasury now experiences in his efforts to maintain even the very small gold reserve of \$100,000,000.

Single capitalists or either one of the largest insurance companies in the city of

New York have more assets than all the gold in the United States Treasury.

It would be easy for speculators to draw all the gold out of the Treasury. A combination to lock up gold might cause serious trouble.

As to the claim of monometallists in every country that gold can always be got from abroad, the statistics show that there is not nearly enough gold on any sound banking basis for any time of general liquidation in several great countries at once.

In some parts of Ireland a small piece of pork used to be suspended by a string from the roof of the hut and the poor peasants sitting around in a circle on the earth floor would eat their potatoes and point at the pork, so that a whole family were supposed to derive satisfaction from a piece of pork sufficient for one individual.

The fact that the business of the world is done now so largely by checks and credits is an element of danger making it more necessary that there should be no

uncertainty as to the adequacy of the final basis of the currency.

The above are only some of the many dangers of the present situation showing the necessity for a thorough study and complete understanding of the question of the final basis of currency, and for prompt and efficient efforts to place our currency on a sound, adequate, permanent, and self-regulating basis.

It is neither necessary nor wise for us to wait for England to act. Her great banks, bankers, promoters, and holders of mortgages have a special interest in desiring a single gold standard as frankly owned by Gladstone. But the mercantile, manufacturing, and agricultural classes and masses there are beginning to understand the position, and are daily increasing their active work against monometallism.

There is one circumstance which would make my plan for Joint-Metallism more easily understood in England.

The commutation of tithes in England is based upon the average market values

of wheat, oats, and barley jointly. This may be called *Joint-Cerealism*.

The *Evening Post* is right in urging "intelligent men" "to engage heart and soul in the great work of public instruction as to the nature and functions of money."

One of the most important of such teachings is that all sound currency must have a sufficient basis of precious metals so as to be always convertible into coin.

The people of the United States prefer to use sound convertible paper money instead of coin.

Probably not 5 per cent., perhaps not 1 per cent., of the present population, outside of the great cities, have ever seen a gold-piece.

The total amount of silver dollars November 1, 1893, was :

In circulation.....	58,725,818 ¹
In the Treasury	360,606,732 ²
Total coinage.....	419,332,550

Pieces of 1000 "Standards" would be more suitable than silver dollars to be

¹ July 1, 1896, 52,175,998.

² July 1, 1896, 371,303,176

deposited in the Treasury for silver certificates, and, when deposited together with gold, would comply with the requirements of the Constitution of the United States.¹

In discussions regarding monometallism and bimetallism, the terms Standard and Medium are sometimes confused.

A Standard may be purely ideal or intangible. But to be of practical use it must be expressed by, in, or through a Medium.

A certain portion of the arc of a great circle is an ideal or an intangible standard of length. When this is expressed by or in a metal measure, as a yard or a *meter*, the metal is the medium, and is longer when warm and shorter when cold. If the metal be of zinc, it will be too frail; if copper, too soft. Brass, which is a mixture of these two metals, is more suitable.

Labor is an ideal standard of value. When it is stored up or expressed in gold, gold is the medium. As gold cannot be increased in proportion to com-

¹ See pages 24 and 80.

modities generally, it is not a just medium by which to express the standard of value.

Silver has increased more than most other commodities, and it is, therefore, not a just medium for this purpose. The excessive increase has been caused largely by the legal ratio between silver and gold having been *permanently* fixed, and below the relative costs of production.

But gold and silver together, half of each, at values always based on market prices, make the best medium for expressing the standard of value, the most suitable medium for measuring and storing up energy.

The history of civilization shows that they have been used about equally as the money of the world.

Burke perhaps furnishes an illustration of a *compound standard* when he says :

“ A disposition to preserve, and an ability to improve, taken together, would be my *standard* of a Statesman.”

Believing that facts and plain statements are more needed than rhetoric, I have thrown together in the Appendix a

number of facts and statistics with the declarations of those whom American monometallists claim as their best friends, and the admissions of such leading monometallists as

Dr. Robert Giffen, author of *Essays in Finance, The Case against Bimetallism, The American Silver Bubble*, etc. ;

Hon. David A. Wells, LL.D., D.C.L., etc., etc., the most distinguished of all our political economists and a champion of monometallism ;

The *London Statist*, that stalwart monometallist ;

And I claim that these prove the necessity of using both gold and silver together as the basis of our currency.

If the people have a right to demand that all money shall be a just and true measure of value, or the representation of a just and true measure of value, according to Secretary Carlisle,¹

And if labor itself is the real standard of value, as stated by Doctor David A. Wells,²

¹ See Appendix, page 84.

² See Appendix, page 85.

And if labor is continually increasing its power of producing all products except gold, as shown by Doctor Robert Giffen,¹

Then it is obviously unfair and dangerous to make gold alone the metallic basis of our currency.

If President Cleveland was right when he said,² "I hope a way will present itself in the near future for the adjustment of our monetary affairs in such a comprehensive and conservative manner as will afford to silver its proper place in our currency," then I may reasonably ask all reasonable monometallists and all reasonable bi-metallists fairly to consider the plan I have proposed, for I claim that it is precisely what the President hoped for.

I am not now debating any question regarding debts already contracted. My plan refers only to providing a currency on a just and safe basis for contracts to be made after the passage of the act.

Safety and equity lie in wedding the two metals together as in that clever ar-

¹ See Appendix, page 88.

² See Appendix, page 79.

rangement of the brass pendulum supporting glass tubes containing quicksilver. Increase of heat lengthens the brass arm, and at the same time raises the quicksilver so that the centre of weight in the pendulum is maintained at a constant distance from the point of suspension.

Both our great political parties at their conventions have declared, in the most distinct manner, in favor of preserving the parity of gold and silver, and using both metals together in our currency.

The President and the Secretary of the Treasury and both Houses of Congress have all most distinctly committed themselves to this policy.¹

The only difficulty is to find some plan to accomplish this in an honest, safe, and permanent way. Such a plan I have endeavored to set forth in my first Letter on Joint-Metallism.²

APPENDIX.

APPENDIX.

PRESIDENT CLEVELAND'S MESSAGE, MARCH
29, 1894.

.
"If both gold and silver are to serve us as money, and if they together are to supply our people a safe and stable currency, the necessity of preserving this parity is obvious.

.
"I hope a way will present itself in the near future for the adjustment of our monetary affairs in such a comprehensive and conservative manner as will afford to silver its proper place in our currency."

Constitution of the United States, Article 1.

Section VIII. Paragraph 1.—“ The Congress shall have power . . . Paragraph 5. To coin money, regulate the value thereof, and of foreign coin, and fix the standard of weights and measures.”

Section x. Paragraph 1.—“ No State shall . . . make anything but gold and silver coin a tender in payment of debts.”

The above shows the “historic and just position” of silver as a money metal under our Constitution. *See page 24.*

Democratic Platform.

“We hold to the use of both gold and silver as the standard money of the country, and to the coinage of both gold and silver without discriminating against either metal, or charge for mintage, but the dollar unit of coinage of both metals must be of equal intrinsic and exchangeable value, or be *adjusted* through international agreement, *or by such safeguards of legislation as shall insure the maintenance of the parity of the two metals, and the equal power of every dollar at all times in the markets and in the payment of debts*; and we demand that all paper currency shall be kept at par with and redeemable in such coin.”—Democratic National Convention held in Chicago, 21st June, 1892.

Republican Platform.

“The American people, from tradition and interest, favor bimetallism, and the Republican party demands the use of both gold and silver as standard money, with such restrictions *and under such provisions, to be determined by legislation, as will secure the maintenance of the parity of values of the two metals, so that the purchasing and debt-paying power of the dollar, whether of silver, gold, or paper, shall be at all times equal.*”—Republican National Convention, June 7, 1892.

“Every dollar put into the hands of the people should be of the same intrinsic value or purchasing power. With this condition absolutely guaranteed, both gold and silver can be utilized upon equal terms in the adjustment of our currency.”—Hon. GROVER CLEVELAND’s letter, September 26, 1892, accepting the Democratic nomination.

“The Republican party is friendly to a restitution of silver to a place of honor

among the money metals of the world. (Applause.) Some of my friends in the West thought I was uttering new doctrines when I declared that I believed the free use of silver upon an international agreement that would assure its continued equality with gold, would do more than anything that I know of, save the establishment of the protection principle, to bring again prosperity into our commerce. (Applause.) The trouble upon this question has been that some of our Western friends would not receive any man as the friend of silver who believed that we could not coin it freely and maintain its parity with gold without coming into an arrangement with the other great commercial nations of the world.

“ They should have been more liberal. I believe to-day that we can see in England, the nation that has stood most strongly against the larger use of silver, and in Germany, a nation that has followed England, the clear indications of the growth of a sentiment for an international agreement upon this question.

It is increasing in power ; and I believe, if rightly and wisely encouraged and directed from America, it will finally bring other nations, by the compulsion of their own necessities, into accord with us upon this subject." (Applause.)—Ex-President HARRISON—Speech at Indianapolis, April 25, 1894.

"The established policy of the United States to maintain the two metals on a parity with each other upon the present legal ratio or such ratio as may be provided by law."—Act of Congress, November 1, 1893.

"Whether it [money] be gold or silver or both, or paper based upon the coins of the two metals, the people have a right to demand that it shall be in fact what it purports to be—a just and true measure of value, or the representative of a just and true measure of value."—Hon. JOHN G. CARLISLE, Secretary of the Treasury.—Speech at Chamber of Commerce Banquet, November 21, 1893.

"There can hardly be a better rule in any country for the legal than the market proportion, if this can be supposed to have been produced by the free and steady course of commercial principles."—ALEXANDER HAMILTON, "Report on the Establishment of a Mint."

"The proportion between the values of gold and silver is a mercantile problem altogether."—THOMAS JEFFERSON, "On the Establishment of a Money Unit and of a Coinage for the United States."

"Labor¹ itself is the real standard of value to which the prices of all the products of labor must adjust themselves."—D. A. WELLS, *Practical Economics*, p. 35.

"Viewing a long period dynamically, it is beyond all question that commodities are comparatively steady and only the money changes."—ROBERT GIFFEN.

"I venture to ask your publication of this short letter, because it is the great depreciation of the currencies of silver—

¹ "Labor is the universal and accurate measure of value."—ADAM SMITH.

using nations which is destroying England's exports to 700,000,000 of those who were formerly her best customers, and it is for this reason, and this only, that the terrible fall in the Eastern rates of exchange since last July has converted London by wholesale to bimetallism, grudgingly and unwillingly, I admit. . . . Yours faithfully, MORETON FREWEN, New York, April 24, 1894."—From a letter to the New York *Tribune*.

The Tabular Standard in Massachusetts.

"BOSTON, January 1, 1780.—In behalf of the State of Massachusetts Bay, I, the subscriber, do hereby promise and oblige myself and successors in the office of Treasurer of said State, to pay unto Asa Kider or to his order, the sum of £239.-11.3 on or before the first day of March, in the year of our Lord 1781, with interest at 6 per cent. per annum; both principal and interest to be paid in the then current money of said State in a greater or less sum, according as five bushels of corn, sixty-eight pounds and four-sevenths parts

of a pound of beef, ten pounds of sheep's wool, and sixteen pounds of sole leather, shall then cost more or less than one hundred and thirty pounds current money, at the then current prices of said articles. This sum being thirty-two times and a half what the same quantities of the same articles would cost at the prices affixed to them in a law of this State made in 1777 entitled, 'An act to prevent monopoly and oppression.'"—A. GARDNER, Treasurer of the State of Massachusetts Bay.

"Between 1851 and 1870 the new supply of gold available for currency averaged \$92,000,000. Between 1871 and 1881 it had fallen to \$24,000,000."—A. SOETBEER.

"About two thirds of the gold annually produced is taken for the arts ; and if the consumption of India is included, as being either for simple hoarding or for the arts, and in no case for the purpose of circulating money, then the demand for gold for non-monetary purposes appears almost equal to the entire annual production."—ROBERT GIFFEN.

Since the discovery of America the world's total production of the precious metals has been in weight about five per cent. gold and ninety-five per cent. silver.

The extremes have been :

1581-1600, average	1.7 %	gold,	98.3 %	silver
1851-1855	"	18.4	"	81.6
In 1892 it was.....	4.	"	96.	"

It is instructive to note how very much more these proportions have varied than have the relative market prices of gold and silver.

For one hundred and eighty-six years (1687 to 1873) the commercial ratio of gold to silver was never less than 14.14, and never more than 15.95, except¹

In 1808, when it was.....	16.08
" 1812, " " "	16.11
" 1813, " " "	16.25

See Soetbeer's tables, and Pixley & Abell's tables.

" It is quite conceivable that if gold were to increase in quantity and its cost of production, to diminish, as other commodities

¹ See note, page 132.

increase in quantity and have their cost of production diminished, there would be no change of any kind in gold prices. Commodities would be more abundant, but the abundance would make itself felt in a rise of money wages, salaries, rents, and profits, and not in lower prices. That it is felt in lower prices now appears to be absolute proof that the relation between gold and commodities has changed, that they have not increased in quantity and had their cost of production diminished *pari passu*. In addition, however, while not denying that there has been a change on the commodities side of the balance, I would go farther and maintain that what has happened to gold in the way of diminished production and increased demands upon it, arising from other causes than the multiplication of commodities, must have had great effect."—ROBERT GIFFEN.

"But the result of carrying on larger and larger transactions on a narrow basis of coin or bullion is to magnify the rela-

tive importance of changes on that article. It may still be true, and I believe it is true, that the bullion in a country under a given set of conditions is the final measure of prices in that country."—ROBERT GIFFEN.

"Population and production are constantly being increased, and the gold used for reserves and small change must be increased in proportion."—ROBERT GIFFEN.

"I should say also that, allowing for almost any progress in the modes of working the precious metals, and for further discoveries like those of Australia and California, the probabilities now are that on the whole this insufficiency of the supply of the precious metals is likely to be permanent."—ROBERT GIFFEN.

"A large and sudden abstraction from the money of a country, if that were conceivable, would be equally potent for mischief. The rich would become enormously richer, and the poor enormously poorer."—ROBERT GIFFEN.

"Prices are the expression of a relation of quality between commodities and gold . . . of course what is said of gold would be true of any other metal used as money."—ROBERT GIFFEN.

"If we are right in holding the view which we unquestionably entertain, that the increase of the gold out-put of the world will soon bring about a rise of prices."—London *Statist*, February 3, 1894.¹

The Banks of Venice and of Amsterdam issued certificates of deposit and promissory notes long before the Bank of England was established.

"At the commencement of the reign of Hian-Tsoug, of the Thang dynasty, in the year 807 of the Christian era, and on the occasion of a great famine, the Emperor decreed that all merchants and wealthy persons should deposit the whole of their gold and silver in the public

¹ This is a very important and late admission as to the effect upon prices of any reduction in the total supply of money metals whether caused by demonitization or by lessened production.

treasury, and in return there were delivered to them notes called 'fey thsian,' or 'flying money.' Three years afterward this paper money was called in at Pekin, but its circulation continued to be authorized in the provinces. In A. D. 906 the paper currency was revised by another Emperor, merchants being permitted to deposit their bullion in the exchequer, and to receive in exchange notes called 'running money.' In 1021 this currency represented a value of nearly three million ounces of silver."—*Klaproth Asiatic Journal*, for 1822.

Marco Polo found paper currency money in China.

¹ From Report for 1895.

"The Republican party is in favor of the use of both gold and silver as money, and condemns the policy of the Democratic administration in its efforts to demonetize silver." — Republican National Platform plank of 1888, reported by WILLIAM MCKINLEY, Chairman of the Committee on Resolutions.

"We know we cannot have free coinage now, except in the manner as provided in the bill. . . . I say that to defeat this bill means to defeat all silver legislation and to leave us with two millions a month only, when by passing this bill we would have four and a half millions a month of Treasury notes as good as gold. For one, Mr. Speaker, I will not vote against this bill and thus deprive my people, and my country, and the laborers, and the producers, and the industries of my country of thirty millions annually of additional circulating medium." [Great applause on the Republican side.]—WILLIAM MCKINLEY, in his speech as Chairman of the Ways and Means Committee and leader of the House of Representatives, June 7, 1890.

“The value of money in general is the quantity of all the money in the world in proportion to all the trade.”—JOHN LOCKE.

“That commodities rise and fall in price in proportion to the increase or diminution of money, I assume as a fact that is uncontrovertible.”—RICARDO.

*Extracts from the Final Report of the
Royal Commission on gold and
Silver, 1888.*

PART I (signed by *all* the members of the Commission).

SEC. 189—“Looking then to the vast changes which occurred prior to 1873 in the relative production of the two metals without any corresponding disturbance in their market value, it appears to us difficult to resist the conclusion that some influence was then at work tending to steady the price of silver, and to keep the ratio which it bore to gold approximately stable.”

SEC. 190—“Prior to 1873 the fluctua-

tions in the price of silver were gradual in their character, and ranged within very narrow limits. The maximum variation in 1872 was $\frac{5}{8}$ d. and the average not quite $\frac{5}{16}$ d., while in 1886 the maximum was $2\frac{9}{16}$ d., and the average nearly $1\frac{1}{8}$ d. It has not been, and indeed hardly could be, suggested that the difference can be accounted for by changes in the relative production or actual use of the two metals."

SEC. 193—"Nor does it appear to us *a priori* unreasonable to suppose that the existence in The Latin Union of a bi-metallic system, with a ratio of $15\frac{1}{2}$ to 1 fixed between the two metals, should have been capable of keeping the market price of silver steady at approximately that ratio.

"The view that it could only affect the market price to the extent to which there was a demand for it for currency purposes in The Latin Union, or to which it was actually taken to the mints of those countries, is, we think, fallacious. . . ."

PART II. Signed by six Members of the Commission : Lord HERSHELL, G.C.B.; Sir C. W. FREEMANTLE, K.C.B.; Rt. Hon. Sir JOHN LUBBOCK, Bart., M.P.; LORD FARRER; Mr. J. W. BIRCH; Rt. Hon. LEONARD H. COURTNEY, M.P.¹

SEC. 99.—We may summarize our conclusions upon this part of the case as follows: We think that the fall in the price of commodities may be in part due to an appreciation of gold, but to what extent this has affected prices we think it impossible to determine, with any approach to accuracy.

We think, too, that the fall in the gold price of silver has had a tendency operating in the same direction upon prices; but whether this has been effective to any, and if so to what extent, we think equally incapable of determination.

We believe the fall to be mainly due, at all events, to circumstances independent of changes in the production of, or demand for, the precious metals, or the altered relation of silver to gold.

As regards the fall in the gold price of silver, we think that, though it may be

¹ Mr. Courtney changed his opinion later on the question of the appreciation of gold, etc. See Appendix page 103.

due in part to the appreciation of gold, it is mainly due to the depreciation of silver.

SEC. III. We may point also to an advantage of a different character which might perhaps arise from the adoption of bimetallism.

There seems reason to believe that the production of gold has been diminishing, and it is uncertain whether this diminution has reached its lowest point.

On the other hand, there is some reason to suppose that the use of that metal in the arts is likely in the future to increase. There can be no doubt too that the population and commerce of nations having a gold standard may be expected to increase largely.

Under these circumstances it may be open to argument that the vast superstructure of credit, which rests upon the gold basis, would run the risk of being disturbed if the standard were found to be appreciating. If, on the other hand, credit were founded on a bimetallic instead of a gold standard, the base upon which

the fabric rests, might be enlarged, and the danger to which we have alluded might be diminished.

SEC. 119. Apprehensions have been expressed that if the bimetallic system were adopted gold would gradually disappear from circulation. If, however, the arrangement included all the principal commercial nations, we do not think there would be any serious danger of such a result.

Such a danger, if it existed at all must be remote. It is said, indeed, by some that if it were to happen, and all nations were to be driven to a system of silver monometallism, the result might be regarded without dissatisfaction.

We are not prepared to go this length, but, at the same time, we are fully sensible of the benefits which would accrue from the adoption of a common monetary standard by all the commercial nations of the world, and we are quite alive to the advantage of the adoption by these nations of an uniform bimetallic standard as a step in that direction.

Part III. Signed by the other six Members of the Commission: Rt. Hon. Sir LOUIS MALLET, C.B.; Rt. Hon. A. J. BALFOUR, M.P.; Rt. Hon. HENRY CHAPLIN, M.P.; Sir D. BARBOUR, K.C.S.I.; Sir W. H. HOULDESWORTH, Bart., M. P.; Mr. SAMUEL MONTAGU, M.P.

SEC. II. In Sec. 47 of Part II., our colleagues express the view that "the greater part of the fall has resulted from causes touching the commodities rather than from an appreciation of the standard; and again in Section 99, "we believe the fall to be mainly due, at all events, to circumstances independent of changes in the production of or demand for the precious metals, or the altered relation of silver to gold."

From this view we feel bound to dissent. The importance of the question whether the incapacity of the existing stock of gold to meet the currency requirements of the world arises from the fact that those currency requirements are increasing through the growth of commerce and of population, or through the monetary policy of particular nations, may easily be exaggerated. In our opinion it is almost impossible to distinguish between these two sets of causes. A great increase in

the production of commodities means a great increase in wealth, and would ordinarily be attended with an increased demand for the standard metal. The prices of some commodities, would fall because they were produced in increasing quantities; the prices of commodities generally would tend to fall because there was an increased demand for the standard metal, and there are no means of saying how much of the alteration in price in any particular case is due to increased production, and how much to increased demand for the standard.

In any case, however, we differ from the view taken by our colleagues, to which we have above referred, for the following reasons:

In the first place we find no proof that the supply of commodities generally has increased, or that the cost of production has diminished at a greater rate in the years which have elapsed since the rupture of the bimetallic par than was the case in periods of like duration, antecedent to that date. . . .

SEC. 12.—There appears to us to be sufficient evidence (to which we shall refer later on when we deal in detail with the several questions contained in our order of reference) to show that the fall of prices and its resulting evils have affected all classes of the population (with the exception of those in the enjoyment of fixed incomes payable in gold), from the manufacturers and producers down to the wage-earners; but, in our opinion, it is the latter class which have the most direct and immediate interest in the adoption of any measure which will re-establish the comparative stability of the standard of value, such as it was before the recent divergence in the relative value of the precious metals.

SEC. 28.— . . . We are strongly of opinion that both metals must continue to be used as standard money; the result of using them separately and independently since 1873 have been most unsatisfactory, and may be positively disastrous in the future.

It cannot be questioned that until 1873 gold and silver were always effectively linked by a legal ratio in one or more countries.

It is equally indisputable that the relative value of the two metals has been subject to greater divergence since 1874 than during the whole of the two hundred years preceding that date, notwithstanding the occurrence of variations in their relative production more intense and more prolonged than those which have been experienced in recent years.

SEC. 29.—In 1873 and 1874 the connecting link disappeared, and for the first time the system of rating the two metals ceased to form a subject of legislation in any country in the world.

The law of supply and demand was for the first time left to operate independently upon the value of each metal ; and simultaneously the ratio which had been maintained, with scarcely any perceptible variation, for two hundred years, gave place to a marked and rapid divergence in the relative value of gold and silver,

which has culminated in a change from 15½ to 1 to 22 to 1.

*From the "Nineteenth Century Review,"
April, 1893.*

I was one of the six members of the Gold and Silver Commission who could not see their way to recommend bimetallism, and reported: "When we look at the character and times of the fall in the prices of commodities . . . we think the sounder view is that the greater part of the fall has resulted from causes touching the commodities, rather than from an appreciation of the standard." In the same paragraph we had said: "We are far from denying that there may have been, and probably has been, some appreciation of gold," though we held it impossible to determine its extent. Let me make a confession. I hesitated a little about this paragraph. I thought there was, perhaps, more in the suggestion of an appreciation of gold than my colleagues believed; but whilst I thus doubted I did

not dissent. I am now satisfied that there has been an appreciation of gold greater than I suspected when I signed the Report, and I should not be able to concur in the same paragraph again. . . .

I have no doubt as to the fact of appreciation ; I believe it to have been serious ; . . .

With the rupture of the bimetallic tie, the ratio has changed enormously, though there has been nothing like the same alteration in the relative production of the two metals. . . .

Five years ago I joined with my friends in deprecating any attempt to establish an international agreement for the free coinage of both gold and silver as standard money. I have advanced with further experience and reflection to the belief that such an agreement is to be desired, and that it could be accomplished with the minimum of change and with great advantage to the empire and the world on the conditions I have suggested.

LEONARD COURTNEY.

Product of Gold and Silver in the United States from 1792-1844, and Annually since.

Statement of the Production of Gold and Silver in the World since the Discovery of America.
From 1493 to 1885, is from table of averages for certain periods compiled by Dr. Adolph Soetbeer.]

Statement of the Production of Gold and Silver in the World since the Discovery of America.—Continued.
The production is the annual estimate of the Bureau of the Mint, for the years 1886-1895.

Period.	Gold.		Silver.		Percentage of production.			
	Annual average for the period.		Total for the period.		By weight.		By value.	
	Ounces, fine.	Value.	Ounces, fine.	Value.	Gold.	Silver.	Gold.	Silver.
1886	5,135,679	106,163,900	93,297,290	120,626,800	5.2	94.8	46.8	53.2
1887	5,116,861	105,774,900	96,123,586	124,281,000	5	95	45.9	54.1
1888	5,330,775	110,196,900	108,827,606	140,706,400	4.6	95.4	43.9	56.1
1889	5,073,790	123,489,200	120,213,611	155,427,700	4.7	95.3	44.3	55.7
1890	5,749,106	118,848,700	126,095,062	163,032,000	4.3	95.7	42.1	57.9
1891	6,320,194	130,650,000	137,170,919	177,352,300	4.4	95.6	42.4	57.6
1892	7,102,180	146,815,100	153,151,762	198,014,400	4.4	95.6	42.5	57.5
1893	7,608,787	157,287,600	166,092,047	214,745,300	4.4	95.6	42.4	57.6
1894	8,737,788	180,626,100	167,752,561	216,892,200	4.9	95.1	45.6	54.4
1895	9,820,125	203,000,000	174,796,875	226,000,000	5.3	94.7	47.3	52.7
Total	424,900,202	8,783,467,400	5	95	45.9	54.1

For commercial value of the production of silver in the world from 1873 to 1895 see page 111.
These estimates are revised by the Bureau to conform to later reports as received from the various countries.

MONETARY SYSTEMS AND APPROXIMATE STOCKS OF MONEY IN THE

	Countries.	Monetary system.	Ratio between gold and full legal-tender silver.	Ratio between gold and limited-tender silver.	Population.	Stock of gold.

The silver unit is the dollar which contains $412\frac{1}{2}$ grains of standard silver 900 fine. The amount of fine silver in the dollar is $371\frac{1}{4}$ grains, and there are $41\frac{1}{4}$ grains of copper alloy. The standard silver dollar was first authorized by the act of April 2, 1792. Its weight was 416 grains 892.4 fine. It contained the same quantity of fine silver as the present dollar, whose weight and fineness were established by the act of January 18, 1837. The coinage of the standard silver dollar was discontinued by the act of February 12, 1873, and it was restored by the act of February 28, 1878. The total amount coined from 1792 to 1873 was \$8,031,238, and the amount coined from 1878 to June 30, 1896, was \$430,700,041. The coinage ratio between gold and silver under the Act of 1792 was 15 to 1, but by the act of 1837 it was changed to 15.988 to 1 (commonly called 16 to 1). This is the present ratio.

* Parity.

NOTE 1.—Specie payments were suspended from January 1, 1862, to January 1, 1879. During the greater part of that period gold and silver coins were not in circulation except on the Pacific Coast, where, it is estimated, the specie circulation was generally about \$25,000,000. This estimated amount is the only coin included in the above statement from 1862 to 1875, inclusive.

NOTE 2.—In 1876 subsidiary silver again came into use, and is included in this statement, beginning with that year.

NOTE 3.—The coinage of standard silver dollars began in 1878 under the act of February 28, 1878.

NOTE 4.—Specie payments were resumed January 1, 1879, and all gold and silver coins, as well as gold and silver bullion in the Treasury, are included in this statement from and after that date.

NOTE 5.—This table represents the circulation of the United States as shown by the revised statements of the Treasury Department for June 30 of each of the years specified.

*Concurrent Resolution Passed by Senate and House
of Representatives in 1878.*

“Resolved, That all the bonds of the United States issued under the acts of Congress of July 14, 1870, and January 14, 1875, are payable, principal and interest, at the option of the government of the United States, in silver dollars of the coinage of the United States containing $412\frac{1}{2}$ grains each of standard silver, and that to restore to its coinage such silver coins as a legal tender in payment of said bonds, principal and interest, is not in violation of the public faith nor in derogation of the rights of the public creditor.”

From Treasury Department Circular July 1, 1896,
Gold coins and standard silver dollars being
standard coins of the United States are not
“redeemable.”

Valuation of Foreign Coins (Act of Oct. 1, 1890).

The value of foreign coins as expressed in the money of account of the United States shall be that of the pure metal of such coin of standard value; and the values of the standard coins in circulation of the various nations of the world shall be estimated quarterly by the Director of the Mint and be proclaimed by the Secretary of the Treasury immediately after the passage of this act and thereafter quarterly on the 1st day of January, April, July, and October in each year.

From the Republican National Platform of 1896.

The Republican party is unreservedly for sound money. It caused the enactment of the law providing for the resumption of specie payments in 1879, and since then every dollar has been as good as gold. We are unalterably opposed to every measure calculated to debase our currency or impair the credit of our country. We are, therefore, opposed to the free coinage of silver, except by international agreement with the leading commercial nations of the world, which we pledge ourselves to promote, and until such agreement can be obtained the existing gold standard must be preserved. All our silver and paper money must be maintained at a parity with gold, and we favor all measures designed to maintain inviolably the obligations of the United States, and all our money, whether coin or paper, at the present standard, the standard of the most enlightened nations of the earth.

From the Platform of the Gold Democrats of 1896.

The experience of mankind has shown that, by reason of their natural qualities, gold is the necessary money of the large affairs of commerce and business, while silver is conveniently adapted to minor transactions, and the most beneficial use of both together can be ensured only by the adoption of the former as a standard of monetary measure and the maintenance of silver at a parity with gold by its limited coinage under suitable safeguards of law.

From the Democratic National Platform of 1896.

Recognizing that the money question is paramount to all others at this time, we invite attention to the fact that the Constitution names silver and gold together as the money metals of the United States, and that the first coinage law passed by Congress under the constitution made the silver dollar the money unit of value and admitted gold to free coinage at a ratio based upon the silver-dollar unit.

We declare that the act of 1873, demonetizing silver without the knowledge or approval of the American people, has resulted in the appreciation of gold and a corresponding fall in the prices of commodities produced by the people ; a heavy increase in the burden of taxation and of all debts, public and private ; the enrichment of the money-lending class at home and abroad, prostration of industry, and impoverishment of the people.

We are unalterably opposed to monometallism, which has locked fast the prosperity of an industrial people in the paralysis of hard times. Gold monometallism is a British policy, and its adoption has brought other nations into financial servitude to London. It is not only un-American, but anti-American, and it can be fastened on the United States only by the stifling of that indomitable spirit and love of liberty which proclaimed our political independence in 1776, and won it in the war of the Revolution.

We demand the free and unlimited coinage of

both silver and gold at the present legal ratio of 16 to 1, without waiting for the aid or consent of any other nation. We demand that the standard silver dollar shall be a full legal tender, equally with gold, for all debts, public and private, and we favor such legislation as will prevent for the future the demonetization of any kind of legal-tender money by private contract.

We are opposed to the policy and practice of surrendering to the holders of the obligations of the United States the option reserved by law to the government of redeeming such obligations in either silver coin or gold coin.

We are opposed to the issuing of interest-bearing bonds of the United States in time of peace, and condemn the trafficking with banking syndicates which, in exchange for bonds and at an enormous profit to themselves, supply the federal Treasury with gold to maintain the policy of gold monometallism.

Congress alone has the power to coin and issue money, and President Jackson declared that this power should not be delegated to corporations or individuals. We therefore denounce the issuance of notes intended to circulate as money by national banks, as in derogation of the constitution, and we demand that all paper which is made a legal tender for public and private debts, or which is receivable for duties to the United States, shall be issued by the government of the United States and shall be redeemable in coin.

PART II.

JOINT-METALLISM *vs.* BIMETAL-
LISM AND MONOMETALLISM.

JOINT-METALLISM *vs.* BIMETALLISM AND MONOMETALLISM.¹

“Bimetallic money is formed by admitting gold and silver to free coinage and making each an unlimited legal tender at a certain relation in value to the other.”

PRESIDENT ANDREWS.

Monometallic money is formed by admitting one precious metal alone to free coinage² and making it the only unlimited legal tender.

Joint metallic money is formed by coining silver coins of the same weight as gold coins, admitting gold and silver both to free coinage when presented together, in quantities of equal value, according to a

¹ See preface to Second Edition.

² Under “free coinage” a small mintage charge (seigniorage) is made. This amounts on gold to about one sixth of one per cent. in England, more than one fifth of one per cent. in the Latin Union, and one half per cent. (maximum) in Germany. It amounted to two thirds of one per cent. on silver dollars in the United States prior to 1873.

Government ratio declared periodically, as being that integral number of standard silver coins which, in the market value of the silver they contain, most nearly equals a standard gold coin of like weight ; and making a gold coin, plus such number of these standard silver coins as shall be equal thereto, according to the current Government ratio, legal tender as twice the amount of the gold coin, for all debts contracted after a fixed future date.¹

In the United States the Treasury would receive these silver coins and gold coins, when presented together in quantities of equal value, according to the current Government ratio, and issue therefor Joint Legal-Tender Currency Certificates, payable half in gold and half in such quantity of these silver coins as may be equal thereto, according to the Government ratio current at the time of presentation.

Joint-metallism would continue the decimal system here, and permit a continued use of our present silver coins. These are now token money. When

¹ See page 5.

the ratio becomes settled it may be best to recoin the 50-cent, 25-cent, and 10-cent pieces, so that they may contain nearly full intrinsic value. No more silver dollars ought to be coined. After a time all our silver dollars could be converted into silver standard coins, and multiples thereof.

A silver coin as heavy as \$5,000 in gold would be more suitable than silver dollars for deposit in the Treasury.

Under joint-metallism the minting charge might provide a fund to meet any possible Government loss from decline in silver.

In the United States, most of the new silver and gold coins would be deposited in the Treasury, for the people in this country prefer to use sound convertible paper money, instead of coin, for all sums of one dollar and over. Among us, gold coin is seldom seen in common use, and five sixths of our silver dollars remain in the Treasury, while the circulation of the remaining one sixth is confined mostly to colored laborers in a few States.

Joint-metallism conforms to the principle of our Constitution that gold and silver shall be our legal tender.¹

It promotes the use of silver equally with gold as the metallic basis of currency, making that basis adequate without impairing the obligation of contracts.

It conveniently adjusts changes in market ratio by altering the number of silver standard coins to equal a gold standard coin of the same weight. These alterations can be made more or less frequent and exact according to whether a larger or smaller gold coin be taken as the gold standard coin.²

It permits nations establishing it to continue to use their own present gold coins and subsidiary silver coins, while it tends to the ultimate establishment of international gold and silver coins, and

¹ "I am certainly of opinion that gold and silver, at rates fixed by Congress, constitute the legal standard of values in this country, and that neither Congress nor any State has authority to establish any other standard or to displace this standard."

DANIEL WEBSTER.

² Such a proportion as 3 gold standard coins to equal 100 silver standard coins might also be admissible.

promotes clear thinking and understanding of what money really is.¹

It avoids entirely the principal accusations against bimetallism, which are : (1) A dishonest impairment of the obligation of existing contracts. (2) A ratio that would be, at times, very different from the market ratio. Most of the arguments against bimetallism and against monometallism do not apply against jointmetallism.

It recognizes the principle that honest money must be " an equivalent as well as a measure."

It makes the measure of value more just and more stable because based on both precious metals jointly.

It prevents speculators from monopolizing the metallic basis of money. It gives a proper elasticity to the volume of the metallic basis of currency, because the production of silver² can always be largely

¹ Money is a potentiality or stored up and readily available energy (see page 20).

² P. 25. " Surely there is a vein for the silver and a place for the gold."

and promptly increased by labor, while the production of gold cannot.

Under joint-metallism, the relative coinage values of gold and silver would be neither permanently nor arbitrarily fixed; but would be variable according to their relative market values. This would obviate the present chief causes of disturbances in trade and finance; for these disturbances have resulted principally from a large change in the relative market values of gold and silver, while no provision had been made for changing the coinage ratio.

It is impossible, now, to determine the most proper ratio except by giving to both the precious metals equal access to a mint. The question of the ratio to be fixed arbitrarily, under present conditions, might break up any international convention. But if gold and silver together had thus equal access to the mints of even the United States alone, there would be established, soon, between them the true economic ratio of values, viz. : the relative costs of production in the poorest mines

of gold and of silver that could be worked at a profit.

The relative market values would then seldom change, and the Government ratio would probably not have to be changed for years, perhaps not for centuries. If, owing to discoveries of mines or to improved metallurgy, the relative production of one precious metal were increased, whenever this appeared sufficient to affect the relative proportions of the world's stock of gold and silver, then one metal would have a tendency to decline in price; but against this tendency would be the knowledge that with any decline in price a larger proportion of this metal would be demanded at the mint and in payment of debts. Moreover, the market price of each being based on the two metals jointly, their relative fluctuations would be lessened, and besides this, the fact that a law was established which provided for adjusting the Government ratio to correspond with fluctuations in the market ratio, would have a strong tendency to obviate these fluctuations and

to prevent speculative attempts to monopolize either of the precious metals.

An international agreement would be advantageous but not necessary to joint-metallism.

The establishment of a legal coinage ratio by France, in 1803, was found sufficient to overcome the variations in the relative costs of production of the two precious metals so far that for sixty-two years the coinage ratio of $15\frac{1}{2}$ to 1 was maintained and the mint of France kept open at this same ratio, during this long period of most remarkable fluctuations in the production of both gold and silver.¹

This fact does not contravene the law that market values are governed by supply and demand. It is an excellent illustration of the law. The principal demand for precious metals is for coinage. A coinage law can increase or diminish the demand for a precious metal and thus affect its market value.

The writings of John Locke and others

¹ The French coinage was at times all gold and at times all silver. Joint-metallism would prevent such alternation.

of his time in favor of a monometallic standard, because of the difficulty of fixing and maintaining a just ratio, distinctly state that the standard must be *silver*. It is astonishing that many gold monometalists quote Locke without mentioning this. Locke wrote : "Silver therefore and silver alone is the measure of commerce . . . The fittest for this use of all others is silver; all other metals, gold as well as lead, are but commodities." And that gold is "not the money of the world nor fit to be so." What I have called joint-metallism was not then invented. But if Locke were living now, it may fairly be presumed from his writings that he would welcome my plan. Before him Oresme, Copernicus, and Bacon, and after him Newton and many other great authorities acknowledged the importance of trying to maintain the coinage of both metals at the market ratio, but they did not hit upon the plan of joint-metallism. Although bimetallism was in general use throughout the civilized world until 1873 (the mint of France being open to both

metals), it is still necessary, in popular discussion, to reiterate some oft repeated historical statements and well established monetary principles.

“The fall of the Roman Empire . . . was in reality brought about by the decline in the gold and silver mines of Spain and Greece. . . . And as if Providence had intended to reveal in the clearest manner the influence of this agent in human affairs, the resurrection of mankind from ruin which these causes had produced was owing to the directly opposite set of agencies being put in motion. Columbus led the way in the career of renovation ; when he spread his sails across the Atlantic, he bore mankind and its fortunes in his bark. The mines of Mexico and Peru were opened to European enterprise.”—ALISON'S *History*.

“The value of money, other things being the same, varies inversely as its quantity.”—JOHN STUART MILL.

“Money has to serve not merely as a medium of exchange, but also as a fair and permanent record of obligations ex-

tending over long periods of time. In this great and fundamental requirement our existing currency totally and lamentably fails."—A. J. BALFOUR.

"Credit cannot permanently supplant money."

All honest and permanent money must have an adequate metallic basis, as is shown by history.

Freight on gold and silver coin and on bullion is by value, not by weight.

Index number tables show how commodities have generally declined since the decline in silver.

Since the discovery of America the world's total production of gold and silver has been in weight about 5 per cent. gold and 95 per cent. silver.

Gold is somewhat more durable than silver.

A single year's production of gold or silver has little effect on the market values of the world's stocks, which are the accumulation of thousands of years.

The coinage ratio of $15\frac{1}{2}$ to 1 having been fixed by France, April 6, 1803, for

seventy years thereafter the relative market values of the two precious metals in London did not vary therefrom more than 3 per cent. for any year (excepting 1808 and 1812, when the variation was less than 4 per cent., and 1813, when it was less than 5 per cent.¹), although the relative production of the two metals varied enormously, being some years, in value, three times as much silver as gold, and some years only about one fourth as much silver as gold.

France long stood alone, but some other countries afterwards adopted her ratio in their mints, and in 1865 Belgium, Italy, and Switzerland joined her in forming the "Latin Union," which was joined by Greece in 1867, and continued free coinage at the ratio of $15\frac{1}{2}$ to 1 until 1873.²

¹ Napoleon's wars, and the cost and risk of transportation, and the suspension of specie payments in England account for most of this variation.

² The Final Report of the Royal Commission on Gold and Silver, 1888, shows that all the twelve commissioners, the monometallists as well as the bimetallists, agreed in the following statement: "Sec. 193. Nor does it appear to us *a priori* unreasonable to suppose that the existence in the 'Latin Union' of a bimetallic system, with a ratio of $15\frac{1}{2}$ to 1 fixed

By this time improvements in metallurgy, etc., had so greatly reduced the cost of producing silver that the "Latin Union" coinage ratio of $15\frac{1}{2}$ to 1 could not be maintained. There was very great difference of opinion as to the proper ratio, and some powerful interests hoped to benefit by the appreciation of gold which would result from demonetizing silver.

As the proper ratio could not be determined except by open competition between the metals in the market, and with a mint open to both metals, on the basis of their relative market values, and as no plan for this had been provided, the mints were closed to silver, and general disaster has resulted.

Joint-metallism would obviate such disastrous results, and would always act as an automatic regulator and as a safety valve.

between the two metals, should have been capable of keeping the market price of silver steady at approximately that ratio.

The view that it could only affect the market price to the extent to which there was a demand for it for currency purposes in the 'Latin Union,' or to which it was actually taken to the mints of those countries, is, we think, fallacious. . . ."

Under joint-metallism, when once established, no variation in the market value of gold and silver could ever make a recoinage necessary. Changes in the relative market values of the precious metals would only diminish or increase the number of standard silver coins that, together with one standard gold coin of same weight, should be legal tender as twice the amount of the gold coin, for debts contracted after a fixed future date.

Bimetallism, as commonly advocated, has the serious defects that a certain ratio is arbitrarily fixed without proper provision for keeping the ratio at all times just, and that it would be unjust to creditors or to debtors, and more plainly so as regards debts incurred before, but payable after, the law should go into effect.

This unscientific bimetallism with a fixed empirical ratio might be a constant menace to the whole community. For while the sanction of a legal ratio is able to overcome small changes in the relative costs of producing the two metals, it is

powerless when changes are great, and as soon as it is seen that either gold or silver coin is likely to command a premium in any country, it is withdrawn from circulation, and panic commonly results.

Besides this, the fixing or the altering of the ratio must become a dangerous political issue unless it be decreed that it shall be adjusted always upon the basis of market values.¹

From the beginning of civilization gold and silver have been used about equally as the money of the world.²

Joint-metallism would continue this beneficent parity, and would provide a sufficient metallic basis of money to check the *illegitimate* decline in prices of commodi-

¹ Numerous writers have recognized the fact that there would be some advantage in a flexible ratio. The following plans have been proposed: Frequent recoinings at market values. Coins of an amalgam of fluctuating proportions. Gold disks framed in silver disks of fluctuating thicknesses. An agreement among nations generally to join in the purchasing of silver, and in fixing the ratio from time to time, etc. All these plans present difficulties which my plan entirely avoids.

² Tables on pages 49 and 50 of the Report of the Director of the Mint for 1893, give the estimated stocks of gold and silver money in the world amounting to \$3,901,900,000 gold, and \$3,931,100,000 silver.

ties which must continue indefinitely under gold monometallism.¹

The decline in prices caused by inventions and discoveries is legitimate, and silver has also been affected by inventions and discoveries.

The decline in prices caused by reducing the total metallic basis of money through the demonetization of silver is illegitimate and is working disaster, and must so work. By making gold alone the metallic basis of money, the demand for gold is increased, and thus its market value is increased at the expense of all other commodities.

Those in authority naturally prefer gold monometallism, because it increases

¹ Sir William H. Houldsworth, in criticism of my book on joint-metallism, says: "It is ingenious, but the plan he suggests has one objection. If the supply of either of the precious metals diminished down to the demand in the arts, I do not see how equal quantities of gold and silver could any longer be sent to the mint as required. Again, I do not care for the ratio being determined by proclamation."

Sir William, who was so able and conspicuous a member of the Royal Commission on Gold and Silver, and of the Brussels International Monetary Conference of 1892, of course appreciates the fact that when there is not enough gold for joint-metallism, *a fortiori* gold monometallism will be impossible.

the purchasing power of their fixed salaries; it also increases the purchasing power of the Government revenues without nominally increasing taxation. More iron-clads, forts, and public buildings, etc., can be built and more soldiers employed when the revenues are on a gold basis and commodities at large have declined. The Government also unfairly profits by the issuing of dishonest silver coin. The burden of public debt is also made to appear smaller than it really is.

National debts, like all other debts, can be paid only by surplus profits. We have had many statements published showing great reductions in our national debt, when in reality it would require more of our available surplus products to pay the nominally reduced debt.

A farmer who pays the same tax on his land when wheat is worth 50 cents as he did when it was worth \$1.00, does not always comprehend that his taxation has been practically doubled.

The decline in silver is most injurious to the United States :

metals), it is still necessary, in popular discussion, to reiterate some oft repeated historical statements and well established monetary principles.

“The fall of the Roman Empire . . . was in reality brought about by the decline in the gold and silver mines of Spain and Greece. . . . And as if Providence had intended to reveal in the clearest manner the influence of this agent in human affairs, the resurrection of mankind from ruin which these causes had produced was owing to the directly opposite set of agencies being put in motion. Columbus led the way in the career of renovation ; when he spread his sails across the Atlantic, he bore mankind and its fortunes in his bark. The mines of Mexico and Peru were opened to European enterprise.”—ALISON'S *History*.

“The value of money, other things being the same, varies inversely as its quantity.”—JOHN STUART MILL.

“Money has to serve not merely as a medium of exchange, but also as a fair and permanent record of obligations ex-

tending over long periods of time. In this great and fundamental requirement our existing currency totally and lamentably fails."—A. J. BALFOUR.

"Credit cannot permanently supplant money."

All honest and permanent money must have an adequate metallic basis, as is shown by history.

Freight on gold and silver coin and on bullion is by value, not by weight.

Index number tables show how commodities have generally declined since the decline in silver.

Since the discovery of America the world's total production of gold and silver has been in weight about 5 per cent. gold and 95 per cent. silver.

Gold is somewhat more durable than silver.

A single year's production of gold or silver has little effect on the market values of the world's stocks, which are the accumulation of thousands of years.

The coinage ratio of $15\frac{1}{2}$ to 1 having been fixed by France, April 6, 1803, for

this country, the wages of our agricultural laborers must fall, and as less of these will find employment in raising wheat and cotton, the competition for employment will become greater in other departments also, and will result, after a period of strikes, etc., in a general decline in wages and a great increase in the burden of debt, and the more so if that debt has to be paid in gold.

Gold monometallism, by diminishing the total metallic basis of currency, and thus causing a continual decline in everything except gold, tends to transform a nation of enterprising farmers, traders, and manufacturers into a nation of wage seekers, with some great money lenders, speculators, and monopolists. For the difficulties and losses of productive enterprise are increased and destructive speculation is promoted.

Business development requires some prudent use of credit. But to incur indebtedness on a gold basis when the world's known stock of gold is less than one eighth of the world's known debts, is

to sell gold short when the short interest is known to be eight times as large as the total known amount of gold in existence.

We are now in danger of another great money panic from the withdrawal of gold from circulation. Under joint-metallism one money metal could not drive out the other, for they would have to be presented together at the mint and would be available together in payment of debts.

Our natural resources and mechanical development must give this country the leading position, even while we may endure much bad fiscal legislation. But if our commerce were relieved from unnatural restrictions, and our currency placed upon the sound, honest, permanent, adequate, and scientific basis of joint-metallism, the final money reserves of the world (the money that can be loaned at the lowest rate) would be held here, and the exchanges of the world drawn in dollars.

There ought to be a commission appointed, consisting of two eminent judges of our highest courts, with, say, David

Under joint-metallism, when once established, no variation in the market value of gold and silver could ever make a recoinage necessary. The decline in prices caused by inventions and discoveries is legitimate, and silver has also been affected by inventions and discoveries.

The decline in prices caused by reducing the total metallic basis of money through the demonetization of silver is illegitimate and is working disaster, and must so work. By making gold alone the metallic basis of money, the demand for gold is increased, and thus its market value is increased at the expense of all other commodities.

Those in authority naturally prefer gold monometallism, because it increases

¹ Sir William H. Houldsworth, in criticism of my book on joint-metallism, says: "It is ingenious, but the plan he suggests has one objection. If the supply of either of the precious metals diminished down to the demand in the arts, I do not see how equal quantities of gold and silver could any longer be sent to the mint as required. Again, I do not care for the ratio being determined by proclamation."

Sir William, who was so able and conspicuous a member of the Royal Commission on Gold and Silver, and of the Brussels International Monetary Conference of 1892, of course appreciates the fact that when there is not enough gold for joint-metallism, *a fortiori* gold monometallism will be impossible.

the purchasing power of their fixed salaries; it also increases the purchasing power of the Government revenues without nominally increasing taxation. More iron-clads, forts, and public buildings, etc., can be built and more soldiers employed when the revenues are on a gold basis and commodities at large have declined. The Government also unfairly profits by the issuing of dishonest silver coin. The burden of public debt is also made to appear smaller than it really is.

National debts, like all other debts, can be paid only by surplus profits. We have had many statements published showing great reductions in our national debt, when in reality it would require more of our available surplus products to pay the nominally reduced debt.

A farmer who pays the same tax on his land when wheat is worth 50 cents as he did when it was worth \$1.00, does not always comprehend that his taxation has been practically doubled.

The decline in silver is most injurious to the United States :

1. Because we are the largest producers of silver.

2. Because we owe more money than any other people.

3. Because our principal exports are wheat, cotton, etc., which have to be sold in competition with India and other countries whose currency is silver, and where wages and the prices of commodities used by laborers remain substantially as they have been for many years.

Cotton and wheat are sold in England at gold prices for pounds sterling, and thus the world's price is determined.

For every pound sterling which a planter in India receives for cotton or wheat sent to England, he can now employ twice as many native laborers as he could a few years ago, *for their wages remain the same in silver coin*, viz. : one quarter of a silver rupee per day.

In view of this fact as to the reduced gold cost of the production of wheat and cotton in India, owing to the fall in the value of silver, or appreciation of gold, I am unable to comprehend how our great-

est economist, my esteemed friend, the Hon. David A. Wells, can maintain what he wrote in his very valuable book on *Recent Economic Changes*, p. 232: "If the fall in the price of all desirable commodities has been an evil, as not a few seem to believe, it cannot be conclusively proved, in respect to even one article, that any such fall has been *extensively* due to any decline in the value of silver or any appreciation of gold."

If Mr. Wells's views have been modified by the course of events since August, 1889, the date of the preface to that book, it would be of the greatest possible advantage to have a public expression from him now.

These facts regarding the fall in prices of wheat and cotton appear to furnish a complete answer to Mr. Atkinson's demand for the name of any one article in which the variation in price since 1873 may not be accounted for without any regard to the ratio of gold and silver.

If silver continues to decline, much less wheat and cotton will be cultivated in

this country, the wages of our agricultural laborers must fall, and as less of these will find employment in raising wheat and cotton, the competition for employment will become greater in other departments also, and will result, after a period of strikes, etc., in a general decline in wages and a great increase in the burden of debt, and the more so if that debt has to be paid in gold.

Gold monometallism, by diminishing the total metallic basis of currency, and thus causing a continual decline in everything except gold, tends to transform a nation of enterprising farmers, traders, and manufacturers into a nation of wage seekers, with some great money lenders, speculators, and monopolists. For the difficulties and losses of productive enterprise are increased and destructive speculation is promoted.

Business development requires some prudent use of credit. But to incur indebtedness on a gold basis when the world's known stock of gold is less than one eighth of the world's known debts, is

as I have suggested, would establish the real facts of the case to the general satisfaction. Like the Royal Commission, which has accomplished more than had ever before been done to elucidate the gold and silver problem, they might present two reports on some points ; but I think they would agree in recommending a plan, and, naturally, I think this plan would be joint-metallism.

To compare large things with small ; for a long time it was impossible to arrange for international yacht races, because of different standards of measurements.

The English claimed that length and breadth made the proper standard. We generally claimed that displacement was the proper standard, and some insisted that sail area was the proper standard.

I moved in the New York Yacht Club, February 1, 1883, for a committee to consider the whole subject, and served on this committee. We had many sessions and many difficulties and disagreements. But after thoroughly threshing out the matter,

we agreed to recommend a joint standard of measurement consisting of half the length added to half the square root of the sail area, with some minor modifications; and I presided at the meeting of the club when this report was adopted, May 28, 1883.

The joint system of measurement is now generally approved, although when it was first talked of many thought it absurdly complicated.

It must be admitted that joint-metallism is more complicated than either monometallism or bimetallism. The natural course of development is from the simpler to the more complex. "Clocks are more complicated than hour-glasses." Civilization is more complicated than barbarism. Just legislation is more complicated than

"The good old rule, the simple plan,
That he should take who has the power,
And he should keep who can."

Mr. Wells and Mr. Atkinson above all others have adequately studied and set forth the effects of the increased produc-

tiveness of labor ; but it seems to me they have not sufficiently considered and expounded the effects of the increased "preciousness imparted to gold" by mono-metallistic legislation.

Walter Bagehot, if living to-day, would be, I think, a joint-metallist. He wrote in February, 1877, shortly before he died :

"*As yet* no one can prove that the permanent value of silver, whether in its relation to gold or to commodities at large, will change so much as to render any alteration necessary."

Since 1877 silver has declined from \$1.20 per ounce (the average for that year) to .63 per ounce, November, 1894, and the index number of gold prices of general commodities has declined, according to Sauerbeck's tables (45 leading commodities average per year), from 94 to 65 (to February 28, 1894) ; or, according to the London *Economist's* tables (22 leading articles January 1, 1877, to January 1, 1894), from 88 to 67.

Joint-metallism is strictly a merit sys-

we agreed to recommend a joint standard of measurement consisting of half the length added to half the square root of the sail area, with some minor modifications; and I presided at the meeting of the club when this report was adopted, May 28, 1883.

Mr. Wells and Mr. Atkinson above all others have adequately studied and set forth the effects of the increased produc-

expense of those who work without enjoying."

Yes! Monometallists and monopolists are near akin.

Monometallism works injustice to debtors.

Bimetallism might be unfair to creditors.

Joint-metallism would be always just and fair to all.

tem, based upon equal opportunities for competition, and upon the limitation of the arbitrary power of the Executive. At present the Secretary of the Treasury has the power to put the country, any day, upon a silver basis. Under that part of the act of 1890 which is still in force, he is authorized to pay out "gold or silver coin at his discretion."

Civil-Service Reform, Tariff Reform, and many other reforms are bound up with this question of monetary reform.

Gold monometallism increases the attractiveness of official salaries, and thus promotes office-seeking and political corruption.

Countries on a gold basis cannot trade freely with countries on a silver basis, unless the relative values of the two metals are controlled and ascertainable by having, in some great country, a mint open to both gold and silver at some calculable and nearly just ratio.

Mr. Samuel Smith, M.P., has ably shown how gold monometallism is *protection* to "those who enjoy without working at the

expense of those who work without enjoying."

Yes! Monometallists and monopolists are near akin.

Monometallism works injustice to debtors.

Bimetallism might be unfair to creditors.

Joint-metallism would be always just and fair to all.

1. Because we are the largest producers of silver.

These facts regarding the fall in prices of wheat and cotton appear to furnish a complete answer to Mr. Atkinson's demand for the name of any one article in which the variation in price since 1873 may not be accounted for without any regard to the ratio of gold and silver.

If silver continues to decline, much less wheat and cotton will be cultivated in

metals), it is still necessary, in popular discussion, to reiterate some oft repeated historical statements and well established monetary principles.

“The fall of the Roman Empire . . . was in reality brought about by the decline in the gold and silver mines of Spain and Greece. . . . And as if Providence had intended to reveal in the clearest manner the influence of this agent in human affairs, the resurrection of mankind from ruin which these causes had produced was owing to the directly opposite set of agencies being put in motion. Columbus led the way in the career of renovation ; when he spread his sails across the Atlantic, he bore mankind and its fortunes in his bark. The mines of Mexico and Peru were opened to European enterprise.”—ALISON’S *History*.

“The value of money, other things being the same, varies inversely as its quantity.”—JOHN STUART MILL.

“Money has to serve not merely as a medium of exchange, but also as a fair and permanent record of obligations ex-

tending over long periods of time. In this great and fundamental requirement our existing currency totally and lamentably fails."—A. J. BALFOUR.

"Credit cannot permanently supplant money."

All honest and permanent money must have an adequate metallic basis, as is shown by history.

Freight on gold and silver coin and on bullion is by value, not by weight.

Index number tables show how commodities have generally declined since the decline in silver.

Since the discovery of America the world's total production of gold and silver has been in weight about 5 per cent. gold and 95 per cent. silver.

Gold is somewhat more durable than silver.

A single year's production of gold or silver has little effect on the market values of the world's stocks, which are the accumulation of thousands of years.

The coinage ratio of $15\frac{1}{2}$ to 1 having been fixed by France, April 6, 1803, for

we agreed to recommend a joint standard of measurement consisting of half the length added to half the square root of the sail area, with some minor modifications; and I presided at the meeting of the club when this report was adopted, May 28, 1883.

The joint system of measurement is now generally approved, although when it was first talked of many thought it absurdly complicated.

It must be admitted that joint-metallism is more complicated than either monometallism or bimetallism. The natural course of development is from the simpler to the more complex. "Clocks are more complicated than hour-glasses." Civilization is more complicated than barbarism. Just legislation is more complicated than

"The good old rule, the simple plan,
That he should take who has the power,
And he should keep who can."

Mr. Wells and Mr. Atkinson above all others have adequately studied and set forth the effects of the increased produc-

tiveness of labor ; but it seems to me they have not sufficiently considered and expounded the effects of the increased "preciousness imparted to gold" by mono-metallistic legislation.

Walter Bagehot, if living to-day, would be, I think, a joint-metallist. He wrote in February, 1877, shortly before he died :

"*As yet* no one can prove that the permanent value of silver, whether in its relation to gold or to commodities at large, will change so much as to render any alteration necessary."

Since 1877 silver has declined from \$1.20 per ounce (the average for that year) to .63 per ounce, November, 1894, and the index number of gold prices of general commodities has declined, according to Sauerbeck's tables (45 leading commodities average per year), from 94 to 65 (to February 28, 1894); or, according to the London *Economist's* tables (22 leading articles January 1, 1877, to January 1, 1894), from 88 to 67.

Joint-metallism is strictly a merit sys-

tem, based upon equal opportunities for competition, and upon the limitation of the arbitrary power of the Executive. At present the Secretary of the Treasury has the power to put the country, any day, upon a silver basis. Under that part of the act of 1890 which is still in force, he is authorized to pay out "gold or silver coin at his discretion."

Civil-Service Reform, Tariff Reform, and many other reforms are bound up with this question of monetary reform.

Gold monometallism increases the attractiveness of official salaries, and thus promotes office-seeking and political corruption.

Mr. Samuel Smith, M.P., has ably shown how gold monometallism is *protection* to "those who enjoy without working at the

expense of those who work without enjoying."

Yes! Monometallists and monopolists are near akin.

Monometallism works injustice to debtors.

Bimetallism might be unfair to creditors.

Joint-metallism would be always just and fair to all.

PART III.
HISTORY OF THE SCIENCE OF
MONEY.

HISTORY OF THE SCIENCE OF MONEY.¹

Nicole² Oresme, the fourteenth century college president and political economist, councillor to Charles V. of France, and Count Bishop of Lisieux, appears to have been the founder of the modern science of money. His *Traictie de la première Invention des Monnoies* was written about 1366.

Nicolas Copernicus, the great astronomer, Canon of Frauenburg, and adviser of Sigismund I. of Poland, wrote *Monete³ Cudende³ Ratio* in 1526.

These works are in the Astor Library, where I found them uncut. They are not in the Mercantile Library.

M. L. Wolowski, the very able editor and annotator of the edition of these

¹ See Preface to Second Edition.

² He signed his name Nicole, not Nicholas.

³ He does not use the diphthong æ in this title.

works published by MM. Guillaumin et Cie., Paris, 1864, says in his *Avant-Propos*:

“Les vues de Copernic sur la monnoie se rapprochent beaucoup de celles de Nicole Oresme ; ce sont les mêmes aperçus, sains et vigoureux c’est la même entente de l’importance attachée à ce que l’instrument des échanges soit maintenu *droit de titre et de poids*, c’est le même jugement porté sur la nature du pouvoir du prince, en ce qui concerne le règlement de la valeur monétaire. Le rapprochement des indications fournies par ces deux grands esprits donne lieu à une étude aussi féconde qu’attrayante.”

Séquin’s *Histoire des Evêques-Comtes de Lisieux*, published in 1832, says of Nicole Oresme, “33^e évêque et 19^e comte.”:

“Ce savant évêque, après avoir fait ses études dans son pays, alla à Paris ; il fut grand maître du collège de Navarre ; il . . . était le plus habile dans les sciences et les beaux-arts, qui fut dans l’université de Paris.”

Dubois, Huet, Mézeray, and others bear similar testimony to the worth of

this grand liberal bishop of the fourteenth century, who first translated into French, the *Ethics*, *Politics*, and *Economics* of Aristotle, was commissioned by Charles V. to translate the Bible into French, wrote against the Ultramontanes, was unsuccessfully accused of heresy,¹ and proved himself a master of theology, mathematics, and political economy.²

Our people are so inventive, and have such confidence in their intuitive ability to determine any question, that a thorough study of even the bibliology of such a science as that of money is generally not considered necessary for an American law-maker or economic writer. Even in England, writers on the money question commonly ignore the older continental writers, and continually speak of the law that poorer money will drive out better

¹ On account of the sermon which he preached before Pope Urbain V. and the College of Cardinals, "Sur les dérèglements des princes de l'Eglise."

² Many other illustrious churchmen have highly appreciated the moral importance of the currency question. In the XIII Century St. Thomas Aquinas was the foremost writer on Political Economy and Currency.

we agreed to recommend a joint standard of measurement consisting of half the length added to half the square root of the sail area, with some minor modifications; and I presided at the meeting of the club when this report was adopted, May 28, 1883.

The joint system of measurement is now generally approved, although when it was first talked of many thought it absurdly complicated.

It must be admitted that joint-metallism is more complicated than either monometallism or bimetallism. The natural course of development is from the simpler to the more complex. "Clocks are more complicated than hour-glasses." Civilization is more complicated than barbarism. Just legislation is more complicated than

"The good old rule, the simple plan,
That he should take who has the power,
And he should keep who can."

Mr. Wells and Mr. Atkinson above all others have adequately studied and set forth the effects of the increased produc-

tiveness of labor ; but it seems to me they have not sufficiently considered and expounded the effects of the increased "preciousness imparted to gold" by mono-metallistic legislation.

Walter Bagehot, if living to-day, would be, I think, a joint-metallist. He wrote in February, 1877, shortly before he died :

"*As yet* no one can prove that the permanent value of silver, whether in its relation to gold or to commodities at large, will change so much as to render any alteration necessary."

Since 1877 silver has declined from \$1.20 per ounce (the average for that year) to .63 per ounce, November, 1894, and the index number of gold prices of general commodities has declined, according to Sauerbeck's tables (45 leading commodities average per year), from 94 to 65 (to February 28, 1894); or, according to the London *Economist's* tables (22 leading articles January 1, 1877, to January 1, 1894), from 88 to 67.

Joint-metallism is strictly a merit sys-

according to the relative market value of the metals in bullion. This was for a long time attempted to be done; but the attempt was finally abandoned as hopeless, and it only led to constant disturbances in the coinage."

Joint-metallism, when established would "regulate the value of the coins according to the market value of the metals" without leading to "disturbances in the coinage."

That my plan of joint-metallism¹ was not invented when these great authorities wrote, does not invalidate it; other valuable discoveries have also been made since then.

It is interesting to note how the difficulties which these great political economists find in maintaining a just bimetalism are avoided by joint-metallism, which is a scientific and honest bimetalism. Their writings show how strongly many of

¹ See page 121. See also page 5, where the plan was stated in a concrete manner, as was necessary for newspaper publication, but the details as to the gold coin to be selected for the standard weight and the periods to be considered, are of course not essential.

them felt the importance of the general coinage and circulation of both metals and at their relative market values, but that they failed to hit upon the plan of joint-metallism, which compels the use of both together, with ratios always based on their relative market values, without frequent recoinings, and prevents one precious metal from driving out the other.

Of Oresme and Copernicus Macleod says : " Nicholas Oresme, afterwards Bishop of Lisieux, who wrote a *Treatise on the Coinage*, which may justly be said to stand at the head of modern economic literature. . . . But the doctrines maintained by these two great authorities are absolutely identical. They are . . . 5. That the coins of gold and silver must bear the same ratio to each other as the metals in bullion do in the market : . . . They quite perceived the impossibility of keeping gold and silver coins in circulation together in unlimited quantities, at a legal ratio differing from the market ratio of the metals. . . . It was left to the genius

of Petty and Locke¹ to discover that the true remedy for the perpetual confusion caused by attempting to keep gold and silver coins in unlimited quantities in circulation together at a legal ratio differing from the market ratio, was to adopt one metal only as the standard, and to make coins of any other metal subsidiary to it, . . . that the coins should be altered in their weights from time to time to meet the alterations in the market value of the metals. Such a plan is absolutely impracticable. It would possess no element of stability. Every change in the market value of the metals would require a fresh calling in and recoinage of the coinage, at an expense and worry which no country could stand. All other remedies being exhausted, there is no resource but to adopt Petty and Locke's¹ plan of Monometallism."

To this I answer that the true remedy is to use the two metals on substantially equal terms according to the plan I have called joint-metallism.

My book, *Joint-Metallism*, appears not

¹ See page 129.

to have been read by Macleod, whose work was published two months after mine. He certainly had no intention of favoring joint-metallism. Indeed he claims that very little metallic money is required for use in the world's trade and commerce.

Macleod is the highest juridical authority on forms and uses of credit, and his very eminence in this department has led him, I think, to a dangerously exaggerated estimate of the position of credits as a basis for currency.

An economist of commanding ability, he is more juridical than judgmatical, a great philosophical writer of history, with a purpose, and more an advocate than a judge.

Macleod mentions, in a note, the edition of the treatises of Oresme and Copernicus published by Guillaumin et Cie., Paris, 1864. But he omits to mention the names of Roscher and Wolowski who had written so ably thirty years before him, regarding those grand old economists. Nor does he mention what Cossa had written in the *Introduction to the Study of Political Economy*.¹

¹ See also Cunningham's *Growth of English Industry and Commerce*.

HISTORY OF THE SCIENCE OF MONEY.¹

Nicole² Oresme, the fourteenth century college president and political economist, councillor to Charles V. of France, and Count Bishop of Lisieux, appears to have been the founder of the modern science of money. His *Traictie de la première Invention des Monnoies* was written about 1366.

Nicolas Copernicus, the great astronomer, Canon of Frauenburg, and adviser of Sigismund I. of Poland, wrote *Monete³ Cudende³ Ratio* in 1526.

These works are in the Astor Library, where I found them uncut. They are not in the Mercantile Library.

M. L. Wolowski, the very able editor and annotator of the edition of these

¹ See Preface to Second Edition.

² He signed his name Nicole, not Nicholas.

³ He does not use the diphthong æ in this title.

A. Wells, Edward Atkinson, General Walker, President Andrews, and five eminent financiers and business men, to be selected by these six, with power to call for papers and to summon witnesses, and authority to prepare and recommend a plan for such treatment of silver as would best promote the interests of our country.

The political positions of members of Congress generally preclude their usefulness upon such a commission.

Questions as to votes to be gained or lost in a member's or in an office-seeker's district must be excluded.

The science of money is one of the most profound, abstruse, and subtle that has ever engaged the human mind. Only those who have been trained by special study, and are accustomed to keep their understandings open, and to patiently investigate, and to seek truth as the greatest good, are fitted to settle the question of the best treatment of gold and silver as regards money.

I am confident that such a commission,

as I have suggested, would establish the real facts of the case to the general satisfaction. Like the Royal Commission, which has accomplished more than had ever before been done to elucidate the gold and silver problem, they might present two reports on some points ; but I think they would agree in recommending a plan, and, naturally, I think this plan would be joint-metallism.

To compare large things with small ; for a long time it was impossible to arrange for international yacht races, because of different standards of measurements.

The English claimed that length and breadth made the proper standard. We generally claimed that displacement was the proper standard, and some insisted that sail area was the proper standard.

I moved in the New York Yacht Club, February 1, 1883, for a committee to consider the whole subject, and served on this committee. We had many sessions and many difficulties and disagreements. But after thoroughly threshing out the matter,

Under joint-metallism, when once established, no variation in the market value of gold and silver could ever make a recoinage necessary. Changes in the relative market values of the precious metals would only diminish or increase the number of standard silver coins that, together with one standard gold coin of same weight, should be legal tender as twice the amount of the gold coin, for debts contracted after a fixed future date.

Bimetallism, as commonly advocated, has the serious defects that a certain ratio is arbitrarily fixed without proper provision for keeping the ratio at all times just, and that it would be unjust to creditors or to debtors, and more plainly so as regards debts incurred before, but payable after, the law should go into effect.

This unscientific bimetallism with a fixed empirical ratio might be a constant menace to the whole community. For while the sanction of a legal ratio is able to overcome small changes in the relative costs of producing the two metals, it is

powerless when changes are great, and as soon as it is seen that either gold or silver coin is likely to command a premium in any country, it is withdrawn from circulation, and panic commonly results.

Besides this, the fixing or the altering of the ratio must become a dangerous political issue unless it be decreed that it shall be adjusted always upon the basis of market values.¹

From the beginning of civilization gold and silver have been used about equally as the money of the world.²

Joint-metallism would continue this beneficent parity, and would provide a sufficient metallic basis of money to check the *illegitimate* decline in prices of commodi-

¹ Numerous writers have recognized the fact that there would be some advantage in a flexible ratio. The following plans have been proposed: Frequent recoinings at market values. Coins of an amalgam of fluctuating proportions. Gold disks framed in silver disks of fluctuating thicknesses. An agreement among nations generally to join in the purchasing of silver, and in fixing the ratio from time to time, etc. All these plans present difficulties which my plan entirely avoids.

² Tables on pages 49 and 50 of the Report of the Director of the Mint for 1893, give the estimated stocks of gold and silver money in the world amounting to \$3,901,900,000 gold, and \$3,931,100,000 silver.

ties which must continue indefinitely under gold monometallism.¹

The decline in prices caused by inventions and discoveries is legitimate, and silver has also been affected by inventions and discoveries.

The decline in prices caused by reducing the total metallic basis of money through the demonetization of silver is illegitimate and is working disaster, and must so work. By making gold alone the metallic basis of money, the demand for gold is increased, and thus its market value is increased at the expense of all other commodities.

Those in authority naturally prefer gold monometallism, because it increases

¹ Sir William H. Houldsworth, in criticism of my book on joint-metallism, says: "It is ingenious, but the plan he suggests has one objection. If the supply of either of the precious metals diminished down to the demand in the arts, I do not see how equal quantities of gold and silver could any longer be sent to the mint as required. Again, I do not care for the ratio being determined by proclamation."

Sir William, who was so able and conspicuous a member of the Royal Commission on Gold and Silver, and of the Brussels International Monetary Conference of 1892, of course appreciates the fact that when there is not enough gold for joint-metallism, *a fortiori* gold monometallism will be impossible.

the purchasing power of their fixed salaries; it also increases the purchasing power of the Government revenues without nominally increasing taxation. More iron-clads, forts, and public buildings, etc., can be built and more soldiers employed when the revenues are on a gold basis and commodities at large have declined. The Government also unfairly profits by the issuing of dishonest silver coin. The burden of public debt is also made to appear smaller than it really is.

National debts, like all other debts, can be paid only by surplus profits. We have had many statements published showing great reductions in our national debt, when in reality it would require more of our available surplus products to pay the nominally reduced debt.

A farmer who pays the same tax on his land when wheat is worth 50 cents as he did when it was worth \$1.00, does not always comprehend that his taxation has been practically doubled.

The decline in silver is most injurious to the United States :

1. Because we are the largest producers of silver.

2. Because we owe more money than any other people.

3. Because our principal exports are wheat, cotton, etc., which have to be sold in competition with India and other countries whose currency is silver, and where wages and the prices of commodities used by laborers remain substantially as they have been for many years.

Cotton and wheat are sold in England at gold prices for pounds sterling, and thus the world's price is determined.

For every pound sterling which a planter in India receives for cotton or wheat sent to England, he can now employ twice as many native laborers as he could a few years ago, *for their wages remain the same in silver coin*, viz. : one quarter of a silver rupee per day.

In view of this fact as to the reduced gold cost of the production of wheat and cotton in India, owing to the fall in the value of silver, or appreciation of gold, I am unable to comprehend how our great-

est economist, my esteemed friend, the Hon. David A. Wells, can maintain what he wrote in his very valuable book on *Recent Economic Changes*, p. 232: "If the fall in the price of all desirable commodities has been an evil, as not a few seem to believe, it cannot be conclusively proved, in respect to even one article, that any such fall has been *extensively* due to any decline in the value of silver or any appreciation of gold."

If Mr. Wells's views have been modified by the course of events since August, 1889, the date of the preface to that book, it would be of the greatest possible advantage to have a public expression from him now.

These facts regarding the fall in prices of wheat and cotton appear to furnish a complete answer to Mr. Atkinson's demand for the name of any one article in which the variation in price since 1873 may not be accounted for without any regard to the ratio of gold and silver.

If silver continues to decline, much less wheat and cotton will be cultivated in

this country, the wages of our agricultural laborers must fall, and as less of these will find employment in raising wheat and cotton, the competition for employment will become greater in other departments also, and will result, after a period of strikes, etc., in a general decline in wages and a great increase in the burden of debt, and the more so if that debt has to be paid in gold.

Gold monometallism, by diminishing the total metallic basis of currency, and thus causing a continual decline in everything except gold, tends to transform a nation of enterprising farmers, traders, and manufacturers into a nation of wage seekers, with some great money lenders, speculators, and monopolists. For the difficulties and losses of productive enterprise are increased and destructive speculation is promoted.

Business development requires some prudent use of credit. But to incur indebtedness on a gold basis when the world's known stock of gold is less than one eighth of the world's known debts, is

to sell gold short when the short interest is known to be eight times as large as the total known amount of gold in existence.

We are now in danger of another great money panic from the withdrawal of gold from circulation. Under joint-metallism one money metal could not drive out the other, for they would have to be presented together at the mint and would be available together in payment of debts.

Our natural resources and mechanical development must give this country the leading position, even while we may endure much bad fiscal legislation. But if our commerce were relieved from unnatural restrictions, and our currency placed upon the sound, honest, permanent, adequate, and scientific basis of joint-metallism, the final money reserves of the world (the money that can be loaned at the lowest rate) would be held here, and the exchanges of the world drawn in dollars.

There ought to be a commission appointed, consisting of two eminent judges of our highest courts, with, say, David

A. Wells, Edward Atkinson, General Walker, President Andrews, and five eminent financiers and business men, to be selected by these six, with power to call for papers and to summon witnesses, and authority to prepare and recommend a plan for such treatment of silver as would best promote the interests of our country.

The political positions of members of Congress generally preclude their usefulness upon such a commission.

Questions as to votes to be gained or lost in a member's or in an office-seeker's district must be excluded.

The science of money is one of the most profound, abstruse, and subtle that has ever engaged the human mind. Only those who have been trained by special study, and are accustomed to keep their understandings open, and to patiently investigate, and to seek truth as the greatest good, are fitted to settle the question of the best treatment of gold and silver as regards money.

I am confident that such a commission,

as I have suggested, would establish the real facts of the case to the general satisfaction. Like the Royal Commission, which has accomplished more than had ever before been done to elucidate the gold and silver problem, they might present two reports on some points ; but I think they would agree in recommending a plan, and, naturally, I think this plan would be joint-metallism.

To compare large things with small ; for a long time it was impossible to arrange for international yacht races, because of different standards of measurements.

The English claimed that length and breadth made the proper standard. We generally claimed that displacement was the proper standard, and some insisted that sail area was the proper standard.

I moved in the New York Yacht Club, February 1, 1883, for a committee to consider the whole subject, and served on this committee. We had many sessions and many difficulties and disagreements. But after thoroughly threshing out the matter,

we agreed to recommend a joint standard of measurement consisting of half the length added to half the square root of the sail area, with some minor modifications; and I presided at the meeting of the club when this report was adopted, May 28, 1883.

The joint system of measurement is now generally approved, although when it was first talked of many thought it absurdly complicated.

It must be admitted that joint-metallism is more complicated than either monometallism or bimetallism. The natural course of development is from the simpler to the more complex. "Clocks are more complicated than hour-glasses." Civilization is more complicated than barbarism. Just legislation is more complicated than

"The good old rule, the simple plan,
That he should take who has the power,
And he should keep who can."

Mr. Wells and Mr. Atkinson above all others have adequately studied and set forth the effects of the increased produc-

tiveness of labor ; but it seems to me they have not sufficiently considered and expounded the effects of the increased "preciousness imparted to gold " by mono-metallistic legislation.

Walter Bagehot, if living to-day, would be, I think, a joint-metallist. He wrote in February, 1877, shortly before he died :

" *As yet* no one can prove that the permanent value of silver, whether in its relation to gold or to commodities at large, will change so much as to render any alteration necessary."

Since 1877 silver has declined from \$1.20 per ounce (the average for that year) to .63 per ounce, November, 1894, and the index number of gold prices of general commodities has declined, according to Sauerbeck's tables (45 leading commodities average per year), from 94 to 65 (to February 28, 1894); or, according to the London *Economist's* tables (22 leading articles January 1, 1877, to January 1, 1894), from 88 to 67.

Joint-metallism is strictly a merit sys-

condensation of his book, lately published, and to which I have referred above. I have expressed my opinion of this work on page 159.

In this article from the London *Nineteenth Century Review* for this month, November, 1894, *The Monometalist Creed*, which I would call a Brief rather than a Creed, it is noticeable that, as in his late book, *Bimetallism*, Macleod still omits to mention even the name of Wolowski, who, in 1864, had so thoroughly disproved the statement that Sir Thomas Gresham was entitled to be considered the great discoverer of what Macleod in 1858 called the Gresham law.

In 1862, Roscher's paper on Oresme's treatise was presented to the Institute of France, and Wolowski's *étude* on Oresme's treatise was read at the annual meeting of the Institute. In 1864, Wolowski printed the original Latin and old French texts, showing that Oresme and Copernicus¹ had understood and declared this law long before Gresham was born. But

¹ Bentkowski published the *Monete Cudende Ratio* in 1816

Macleod continued to claim it as Gresham's great discovery.

Thus in his *Elements of Banking*, published in 1876, Macleod says: "Sir Thomas Gresham explained the cause, whence we have called it Gresham Law."

And even in the last edition of his *Theory of Credit*, vol. ii., published in 1890, Macleod says: "Sir Thomas Gresham first explained the reason to Queen Elizabeth, and therefore we have called it 'Gresham Law of the Coinage,' and this name is now universally recognized."

But in the English edition of Cossa's great standard work, published in 1893, *Introduction to the Study of Political Economy*,¹ the facts as stated by Wolowski are plainly set forth in English, and now in Macleod's book, published in July, 1894, and in his magazine article, published this November, Macleod says that "it ought to be called the law of Oresme, Copernicus, and Gresham," but he does not mention Wolowski's name, although he is plainly much indebted to Wolowski's very able work, and to the important notices it con-

¹ This work contains a valuable bibliography.

PART III.
HISTORY OF THE SCIENCE OF
MONEY.

HISTORY OF THE SCIENCE OF MONEY.¹

Nicole² Oresme, the fourteenth century college president and political economist, councillor to Charles V. of France, and Count Bishop of Lisieux, appears to have been the founder of the modern science of money. His *Traictie de la première Invention des Monnoies* was written about 1366.

Nicolas Copernicus, the great astronomer, Canon of Frauenburg, and adviser of Sigismund I. of Poland, wrote *Monete³ Cudende³ Ratio* in 1526.

These works are in the Astor Library, where I found them uncut. They are not in the Mercantile Library.

M. L. Wolowski, the very able editor and annotator of the edition of these

¹ See Preface to Second Edition.

² He signed his name Nicole, not Nicholas.

³ He does not use the diphthong æ in this title.

amateur like myself to claim to rival them in ability or research.

Besides this I don't object when they overthrow those unscientific bimetallists who want a fixed empirical ratio.

Neither do I object to the masterly manner in which A. J. Balfour and Archbishop Welsh belabor and overthrow the gold monometallists.

I say, more power to their elbows, good luck to their club, golf stick, shillalah, and crosier. The more the mutually destructive fight wages between the gold and the silver champions, the more the way will be prepared for joint-metallism.

In all this discussion, and in all the efforts put forth by our statesmen, capitalists, and great financial newspapers to maintain the diminishing Government gold reserve, the one thing that stands out clearly is the fact that there is not enough gold to form a sufficient basis for the currency, commerce, and credits of the world; and that if we don't want to see this country on a silver basis, it is necessary now to consider some way of

using both the precious metals together, and always at their market values.¹

I think joint-metallism presents a convenient and sufficient basis, and until this view is shown to be erroneous by facts and fair arguments, I must continue so to think.

¹ See page 66, etc., for an account of some dangers of the present situation.

PART IV.
THE APOTHEOSIS OF CREDIT.

**OBJECTIONS ANSWERED AND
HONEST LEGISLATION
DEMANDED.**

THE APOTHEOSIS OF CREDIT.

Macleod's favorite theory is that "credit is as good as money." He says: "If a bank can maintain in circulation a quantity of credit in excess of the cash it holds, that is, for all practical purposes, an augmentation of the capital of the country." And he expresses great admiration for a system of banking based on the use of only five per cent. of specie.

His credit theory has just found a happy illustration in Newfoundland, where there is to-day general bankruptcy, because they have little specie although they have much fish and plenty of notes based on general assets, etc., a kind of security highly appreciated by those who favor the Administration - Baltimore - Canadian system of currency (which may be called, for short, the A. B. C. system), and who will not admit that what is needed is more specie money and less credit money.

The holder of a Newfoundland bank-note will be lucky if he can get fish for it, and then if he wants to buy a newspaper, he can take a codfish out of his pocket and put back three mackerels and two herrings received as change.

Some persons, hearing that rich people get their living by cutting coupons off Government bonds, come to think that a people can live upon the interest of what they owe, and that if the Apostle Paul were living now he would write, "Owe all men everything," instead of "Owe no man anything." But it will not be easy to convince thoughtful people that A. and B., by exchanging their promises to pay, can augment the capital of the country.

Gold and silver are suitable for money; fish and other kinds of merchandise are not. Paper currency based on gold and silver at their relative market values, is good currency. If based on fish or other kinds of merchandise, or on credits, it is generally bad currency. Credits based on sales of wheat, cotton, fish, etc., to re-

sponsible merchants, are more safe than credits based on sales of wild lands and mining stocks to speculators; and the great New York banks will never agree to guarantee the notes of small Western banks, based largely on general assets.

In Canada there are few banks. They know each other well and have numerous branches. But to try to introduce their currency system here, where we have 3756 National Banks,¹ is unwise.

If it were certainly known in what our Government bonds were to be paid, there would be no difficulty in disposing of them abroad.

It is unreasonable to give a creditor the right to choose whether he will be paid in gold or in silver, at a ratio different from the market ratio. It is unreasonable to give a debtor the right to choose whether he will pay in gold or in silver, at a ratio different from the market ratio. But to say that all payments for contracts made after a certain fixed future date shall be payable half in one precious metal and half in the other precious metal, at the

¹ And as many other banks.

market ratio, is just, and this is joint-metallism.

I have shown elsewhere¹ how joint-metallism presents a convenient, honest, safe, and permanent basis for currency. If it were established here, the exchanges of the world would come to be drawn in dollars, and the final banking reserves of the world held in New York.

Mr. Carlisle's monstrously ingenious currency plan combines the objectionable features of a National Banking Trust and an Assessment Insurance Company.

The terrible danger is that it may be forced through Congress by political methods and the plea of Treasury necessities, and without sufficient intelligent and thorough discussion.

If, as in the English Parliament, our head of the Treasury Department had a seat in the National Legislature, and were obliged, rising in his place and in fair and real debate, to answer the attacks of educated economists upon his plan, he would soon be out of office.

If, in a time of peace, we establish a

¹ See page 121 ; also page 5.

permanent system of Government credit money, such as that proposed by the Secretary of the Treasury, it may temporarily benefit some banks and speculators, and facilitate some reorganization schemes, and enable promoters to dispose of their holdings, but it will make it impossible for this country to attain the paramount position which our population and developed resources entitle us to assume in the near future.

It is perhaps, too much to expect that all who take part in the legislation upon our currency should be great economists or learned historians. But it may reasonably be expected that they should know the difference between Bullion and Billon, and at least be acquainted with past American monetary experiments.

I see that the debate on the new Currency Bill in the House of Representatives is to be adjourned over Thursday¹ of this week, for the reception of the statue of Daniel Webster, etc.

At that grand function it would be most

¹Originally printed in the *World* of December 18, and the *Tribune* of December 20, 1894.

appropriate to read Webster's words of warning, as follows :

"I am certainly of opinion that gold and silver, at rates fixed by Congress, constitute the legal standard of values in this country, and that neither Congress nor any State has authority to establish any other standard or to displace this standard." No man ever expressed his appreciation of the real use of credit more strongly than he. But Daniel Webster opposed legal-tender credit money.

We are soon to have a great celebration of the 250th Anniversary of the Capture of Louisbourg. As our Society of the Colonial Wars has done me the honor to appoint me on the Committee for the memorial, I call to mind, among other things, that this first great outside adventure of the American Colonies was the cause of our first large experiment in credit currency. It led Massachusetts to issue two and a half million pounds of credit money which soon fell to nine per cent. of its nominal value, and the State was only saved from financial ruin by the

English ransom of Louisbourg from the Colonies, and by the wisdom of Governor Hutchinson, who secured for his State, payment from England, mostly in silver dollars, so that Massachusetts became known as the "Silver Colony," while the neighboring Colonies kept their depreciated currency, and lost their trade, which was transferred to Massachusetts. Newport then rapidly declined in importance, while the supremacy of Salem and Boston was established.

If our people could only grasp the situation, they would see that we have the greatest opportunity ever offered to any country to control the finances of the world. It is not by locking up and permanently maintaining thirty per cent. of our pernicious greenbacks, to promote the issue of three times as large an amount of paper currency, the volume of which would be more than eight times as great as the gold on which it would be based finally. It is not thus that we can solve our currency question and the world's gold and silver question. But we can

solve these problems by joint-metallism, a plan¹ by which gold and silver together, at ratios always based on their relative market values, may be made the metallic basis of a sound,² honest, self-regulating, and permanent currency, without frequent recoinings, and without danger of one metal driving out the other.

¹ See page 121.

² Daniel Webster said in the Senate, March 18, 1854: "I hold the immediate convertibility of bank notes into specie to be an indispensable security to their retaining their value."

**OBJECTIONS ANSWERED, AND
HONEST LEGISLATION
DEMANDED.**

OBJECTIONS ANSWERED, AND HONEST LEGISLATION DEMANDED.

Criticisms of joint-metallism have been mostly favorable, but some objections have been raised.

All the principal objections seem to be comprised in the following two :

1. That under joint-metallism the mint ratio might have to be changed often.
2. That under joint-metallism the final standard would still be gold.

The reply to the first objection is that the ratio would not have to be changed often, because the world's stocks of the precious metals being the accumulation of many centuries, any change in their relative production for a few years, *e. g.* four times as much gold as silver in value, or four times as much silver as gold in value, makes little difference in the total pro-

portion of gold to silver in the world's stocks.¹

As Adam Smith pointed out 118 years ago, their "durableness is the foundation of this extraordinary steadiness in price."

When once joint-metallism has been established and the economic ratio has been determined, *i. e.* the relative costs of production in the poorest mines of gold and of silver that can be worked at a profit, then, so long as it is known that both precious metals will have substantially free access to a mint, in some great country, the ratio of their market values is not likely to change for years,² and may not change for centuries, and, as I have more fully explained on page 127, joint-metallism, in still other ways, promotes steadiness in the ratio, as, for example, by the provision that, at the mint, gold and silver must be presented together in quantities of equal value.

But whenever it is found that, for a long period of time, the mint ratio is very

¹ See page 88.

² See pages 6, 131-133.

different from the relative costs of production, and if it be known that no provision exists to correct this, and that one metal is in danger of being demonetized, and thus the chief demand for it abolished, then there will ensue great fluctuations in the value of that precious metal as compared with the other ; and speculation will come to deal with estimates and opinions and conjectures as to whether a mint will again be open to it, and when and at what ratio, etc.

It is precisely this condition that has existed since 1873, and which could not exist under joint-metallism.

In reply to the second objection :

For the sake of convenient statement and illustration, I have commonly spoken of the ratio as being so many silver standard coins to equal one gold standard coin of same weight, and of changing, when necessary, the number of silver standard coins to equal the gold standard coin.

But the principle of joint-metallism is to have all debts, contracted after a cer-

tain fixed future date, payable half in gold and half in silver, *i. e.* in equal proportions of value of each precious metal, or in joint legal-tender certificates for such equal proportions; and a joint-metallic system might be so arranged that the silver standard coin would be more exactly as much the final standard as the gold standard coin. But this would be complicated, and a discussion of anything like compound ratios would be difficult in a popular treatise, and the form of joint-metallism herein set forth is sufficient for practical purposes, for so long as the Government ratio is kept at approximately the market ratio, and while there is an existing provision for changing the Government ratio when necessary, it will not frequently have to be changed.¹

Supposing the principle of joint-metallism to be adopted this winter or next spring, to go into effect January 1, 1896, the result would be as follows:

Silver would advance in value until the true economic ratio would be reached as

¹ See page 127.

nearly as could be generally estimated with the knowledge that both precious metals were about to have substantially equal access to our mints. So by January 1, 1896, or soon thereafter, the relative market values of gold and silver would become settled, and the Government ratio would then probably not change for many years.

It is also to be remembered that while the law would provide for payment in gold standards and silver standards jointly, the actual transactions would be in legal-tender joint certificates. The buyer or seller would not be affected to any considerable extent by any change in the ratio, except that the *security* pledged for the Government legal-tender joint certificates might possibly be affected to the extent of about one and one half per cent.¹ at any time of altering ratio, but this is too remote to have any practical bearing on the question so far as the buyer and seller are concerned. The Government would assume a small risk for

¹ See page 6.

which the minting charge (seignorage) might be made to pay.¹

It is also to be noted² that joint-metallism permits the continued use of dollars and cents as the terms to be used in contracts and in accounts, and permits the continued use of our present subsidiary coins.

Silver standard coins need not be used at all as small change, although they might be so used conveniently, in some circumstances, as, for example, in case the gold standard coin should be the \$5 gold piece, and the ratio should become fixed at 1 to 20, the silver standard would be worth exactly 25 cents, or at 1 to 25, it would be 20 cents, at 1 to 30, one sixth of a dollar, or at 3 to 100, 15 cents, etc., etc.

It is probable that by January 1, 1896, or soon thereafter, other nations would follow our example and open their mints to silver on a similar basis.

¹ See pages 7 and 123. In Australia the Government makes a profit out of permanently guaranteeing land titles for a charge of one eighth per cent.

² See page 122.

I do not feel called upon to refute some objections which show plainly that the writers have not carefully considered what I have fully explained in preceding pages. As to those who object that joint-metallism is bimetallism, I must refer them to pages 118, 121, 125, 134, 147, etc.

I do not attempt to deny that I am a bullionist in the sense of holding that all Government money should be coin, or readily convertible into coin.

The enormous business, finances, and credit of England are on a bullionist basis, for the uncovered Bank of England notes, limited to £15,000,000, are comparatively inconsiderable.

The United States have set an example to the world in paying off a large part of a Government debt.¹ This was a prepayment. If we paid off the greenbacks, which are a demand debt, we could place our finances in a position which no other nation could attain.

Now that we can export largely iron and other manufactures, as well as grain,

¹ See page 137.

cotton, and other produce, we have the opportunity to take the foremost financial position, with all the advantage and profit which this implies.

But to accomplish this our national money must be based strictly on the only possible sound and sufficient basis, the two precious metals together, limited by the quantities in existence and the costs of production.

Credit can then have its full legitimate development.

But credit money cannot be suitable money with which to do the world's business.

Joint-metallism would be most suitable for the world's business, and contracts under it would be more safe as well as more just.

Mr. Carlisle came to New York and declared for sound money—specie or paper based on specie,—a just and true measure of value, etc. His words are quoted on page 84. But as soon as he had induced New York bankers to take his bonds, he declares for credit money. Under the

plea of war necessity, our people have acquiesced in Government credit money, as a temporary expedient. Mr. Carlisle's distinct purpose is, now, to make credit money a permanent institution.

Momentous results now hang upon the decision of Congress and of a President elected upon the distinct pledge contained in his letter of acceptance dated September 28, 1892, as follows :

"Every dollar put into the hands of the people should be of the same intrinsic value or purchasing power. With this condition absolutely guaranteed, *both gold and silver can be utilized upon equal terms in the adjustment of our currency.*"

The last Democratic National Convention declared: "We hold to the use of *both gold and silver as the standard money of the country, and to the coinage of both without discrimination against either metal,*" etc.¹; and the last Republican National Convention demanded "*the use of both gold and silver as standard money.*"

¹ See page 81.

So late as March 29, 1894, President Cleveland said in a Message to Congress :

" I hope a way will present itself in the near future for the adjustment of our monetary affairs in such a comprehensive and conservative manner as will *afford to silver its proper place in our currency.*"

Honesty in politics and in legislation demands that the foregoing distinct, formal, and solemn pledges be carried out, and that a Bill be passed by Congress and signed by the President *to utilize gold and silver upon substantially equal terms as standard money.*

If they cannot agree upon a Bill for this purpose it is their bounden duty to appoint a commission of competent experts to investigate and to recommend a plan.

PART V.

**SARATOGA FREE-COINAGE
DEBATE.**

**LETTERS TO "SPRINGFIELD
REPUBLICAN."**

AFTER THE ELECTION, WHAT?

EXTRACTS FROM THE DEBATE ON
FREE COINAGE OF SILVER, BE-
FORE THE AMERICAN SOCIAL
SCIENCE ASSOCIATION AT SARA-
TOGA, SEPTEMBER 6, 1895.

*From the Introductory Remarks by the Secretary of
the Finance Department, Professor F. W. Jenks.*

. . . The silver question has become the im-
portant topic of the day, and is likely to be the most
important question of the next political campaign.
It has been thought best, therefore, to have the mat-
ter talked out to-day before the Association by
some of the best authorities on both sides that the
country affords ; and the debaters have agreed to
let the question take the specific form :

*Resolved, That the United States should provide, by
law, for free coinage of silver at the ratio of 16 to 1
with gold.*

From Address of Hon. A. F. Warner.

. . . Twenty-five years ago there were not
forty millions of people out of the entire popula-
tion of the world using gold exclusively as money :

to-day there are more than three hundred million such people.

. . . In 1869 Mr. David A. Wells made a report for 1868, stating our debt abroad—I do not mean the government debt alone—at \$1,500,000,000. Professor Cairnes, a few years later, put our debt to England alone at £300,000,000 (which was about the same thing), and the average interest, dividends, etc., including what was then spent abroad by travellers, at \$175,000,000 a year. If we start with that, and add the annual interest that we are now to pay, and what has probably been expended by travellers abroad, and for the carrying trade, and deduct the balances in our favor from those against us, we should find that our debt to-day is more than \$5,000,000,000. Upon that we have the authority of Professor Thorold Rogers. We have this statement direct from him, as well as from Mr. Gladstone,—that the investments of England alone in other countries are more than \$10,000,000,000. Certainly 40 per cent. of that is invested in the United States. Mr. Heidelberg, one of the large exporters of gold from New York, in the February *Forum* placed our annual dues abroad at \$350,000,000—\$75,000,000 as interest, \$75,000,000 as dividends, \$100,000,000 expended by travellers, and \$100,000,000 in the carrying trade. . . .

From Remarks of Hon. Josiah Patterson.

. . . The silver dollar stands on a somewhat different footing. It is coined money. It is not

the promise of the government to pay anything. But the coinage is limited. It is denied free and unlimited coinage, and is in no sense standard money. The government of the United States collects annually about \$350,000,000 in the way of revenue. These silver dollars are a full legal tender for all those revenues. Consequently, every silver dollar now coined can find its way into the Treasury of the United States at least once every year. As long as the government receives, therefore, these silver dollars into its Treasury on an equality and on a parity with gold, and pays gold on its own obligations, it follows, as night follows the day, that the parity is maintained between gold and silver. . . .

From Remarks of Joseph Sheldon, Esq.

. . . Ours was originally a government of law, and not of arbitrary power in the hands of any President or Secretary of the Treasury. Till very recent times parties dealing with the government have been subject to the wholesome rule that they must take notice of the limitation of the powers of those assuming to act in behalf of the government. That rule must be restored, and must be inflexibly maintained.

The public faith has never been pledged to pay the obligations of the government in gold coin. Not a statute exists that by any possible legal construction supports that claim. Not a statute exists in regard to any form of the public debt or in re-

gard to the coinage of silver dollars that does not positively show that this claim is utterly without foundation. . . .

From Address of Hon. Roswell G. Horr.

. . . To-day gold is the money of the civilized world simply because it is the best substance known to the human race for the large transactions of the civilized world, and for no other reason.

Of course, I dispute from beginning to end the whole doctrine of the last speaker about the quantity of money governing prices. I cannot stop to argue such a proposition as that, but will simply say it is the worst humbug of this age of humbugs. What the people need is good money ; and, when you have good money, you cannot get too much of it. If you resort to poor money, you cannot have too little of it. . . .

From Remarks of A. B. Woodford, Esq.

. . . That then will produce the equilibrium. That movement of poor gold mines going out and poor silver mines coming in will produce it. Now the question arises, can an act of Congress achieve that? One group of economists maintain that bimetallism is a scientific impossibility. They insist that the government cannot give value to a commodity. I submit that it can by giving a new market. . . .

Saratoga Free-Coinage Debate. 213

From Remarks of Senator Higgins.

. . . The disparity of the metals operates as a tariff against the silver-using countries' imports, and a bounty upon the India exports to gold-using countries. . . .

I believe there is no solution of this question except by giving back to silver its imperial and royal function as a money metal of full debt-paying power. But I want my friends to restrain their enthusiasm when I couple that proposition with the other one, which I lay down with equal emphasis, that never can be done until all the world comes into a bimetallic agreement ; and that is until England agrees. That is where I stand. I do not believe anything else is bimetallism. . . .

I do not expect to see prosperity while the disparity of metals continues. . . .

From Remarks of Anson Phelps Stokes.

I am opposed to the coinage of silver at 16 to 1. I am opposed to it, not because I believe in gold monometallism. I am equally opposed to that. I believe there is a solution of this whole difficulty which reasonable men in time may come to ; and that is the free coinage, on substantially equal terms, of both gold and silver, in quantities of equal value, at the ratio of their market values. . . . This would work no injury to any just interest.

I would have the silver in new silver standard

coins to be equal in weight to the gold in the gold standard coins ; and I would open the mint to the free coinage of both gold and silver, when presented together in quantities of equal value of each metal, according to the government ratio of the time, which should be based always on the market ratio, and change only when the market ratio changed as much as one integer,—*e. g.*, from, say, 25 to 1 to 24 to 1, or from 29 to 1 to 30 to 1. The true economic ratio would thus soon be arrived at, and would very seldom change ; and any change would not make recoinage necessary.

I would have a currency so based, half on gold and half on silver, legal tender for the payments of debts contracted after a date some months later than the passage of the act. . . .

The officers of the Association were kind enough to invite me some time ago to take part in this debate, and I then felt that the controversy had got to go on for some time under conditions unfavorable to any attempt at arrangement between the gold and silver parties, and that the time for compromise must be deferred.

To-day I am much encouraged to think that this time is more nearly approaching. I feel that those who have spoken here for gold monometallism are willing to have a larger use of silver, if it can be had safely and honestly, and those who have spoken for silver are willing that we should try 16 to 1, and then, if it does not succeed, to have a different ratio. My proposition is that the United

States should decide to begin at a fixed future date to coin both metals, when presented together in quantities of equal value, and at the market ratio of the time when this new coinage begins, and to change the ratio when necessary.

The great thing that we have to consider now is the danger of the position in which we are at the present moment. That, it seems to me, has been lost sight of in this debate, except by the gentleman who has just spoken, and whose remarks I have listened to with the greatest interest. It is that to which we should address ourselves,—that position, which is degrading to our gold-using countries, making it impossible for them to compete with silver-using countries.

General prosperity in our country depends largely upon the prices obtainable for our chief exportable staples. The fall in these is directly caused by the demonetization of silver, because for every pound sterling which a planter in India, etc., receives for cotton or wheat sold in England, he can now employ twice as many native laborers as he could a few years ago, for their wages remain the same in silver coin.

That is what we come to in the end. What is our position at the present moment? We are having to pay abroad \$1,000,000 per day, and we cannot go on doing it unless we can export much more surplus products. We are getting less into condition to do this than we have been. The danger is that there is an appearance of prosperity which

has been brought about during the last few months by the operations of speculation in sterling exchange. The American people have got hold of some money, and think they are going to have a good time.

In reply to his invitation, I wrote to our Secretary, July 27th :

"The times are not propitious for moderate views or for efforts for accommodation between the partisans of gold and the partisans of silver. The artificial appearance of prosperity produced by the gold which government has borrowed at an exorbitant rate has intoxicated the people, who now expect to be saved by getting deeper in debt, and are unwilling to be reminded of the day of reckoning.

"So I must wait to appeal to Philip sober, as he will be when gold exports commence again in earnest after the government's partnership in exchange speculation comes to an end. In this partnership the government put in its credit and the good-will of the business, and the other partners contributed experience."

. . . It is well known that the bonds sold abroad are for the most part coming back. It is well known that we can, if we are willing to remain in such a dependent condition, go on for some years in that way, with frequent issues of government bonds. But, unless we can get into a position to export more of our surplus products, we cannot reduce our foreign debt nor get out of danger.

Our greatest danger is our greenback currency, which is at least twice as dishonest as our silver currency, for there is more than half a dollar of real value behind each silver dollar or silver-dollar note.

I have enjoyed this debate very much indeed, although I do not agree with either side. I do hope that we shall not think only of the simple proposition of 16 to 1, but that we will think of the greater proposition of putting our currency on a safe basis. If credit money is good money, then fiat money is the best money, because the government's credit is the best credit. What we want is more real money and less credit money. What we want is that no dollar shall be issued that does not have a specie dollar behind it. As the human character is constituted, we shall never have any safety except on that basis.

PROPOSED CURRENCY PLANK.

To the Editor of the "Springfield Republican" ¹:

SIR: How would the following do for a Democratic currency plank?

The Democratic party asserts again its historic belief in hard money—gold and silver freely coined at a ratio regulated by Congress—the only legal tender contemplated by the Constitution ²—and demands that the greenbacks and paper money based on bonds and issued for the benefit of banks and speculators shall be replaced by coin and coin certificates of deposit, and that in this country nothing shall be money that does not honestly represent labor.

The Democratic party, which has always opposed monopolies, denounces the gold monopoly as the most oppressive of all.

THE BIRDS AND THE FARMERS.

To the Editor of the "Republican" :

Most of the political platforms are claiming to favor bimetallism. Some demand it now, others want us to wait until European nations help us to attain it.

This brings to mind the old fable of the mother bird telling her young that they must leave soon their nest in the wheat fields, as it was time for harvest. The little birds said : " Mother, we overheard the farmer tell his sons to go and ask his neighbors and friends to come and help him reap to-morrow." The mother bird replied : " There is no danger yet." The next day the little birds reported that the farmer had sent for his relations to come and help him cut the grain. But the mother bird would not take her little ones away. The following evening they heard the farmer say to his sons : " We will come ourselves to-morrow and reap this field." Then the birds left. " Who would be free, himself must strike the blow." When you hear a man say that undoubtedly your claim is just, but that you had better wait and sell him some more produce on credit and wait until he can conveniently pay you and others all together, you will do well to look out for your own interest.

As a Berkshire farmer I am considering whether we farmers had better now buy and pay for silver bricks to be delivered when England adopts bimetallism.

AS BETWEEN SILVER AND GOLD.

AND AS BETWEEN WEST AND EAST.

**ASSOCIATES PRESS OF NEW YORK AND LONDON
ARTICLES FOR A FAIR HEARING, IN GOOD TEMPER,
AND ESPECIALLY SPEAKS FOR SILVER AND THE
WEST.**

To the Editor of the "Register" :

In these times of angry dispute over an old problem in economics, it is pleasant to find a leading journal keeping its head, giving each party a fair hearing, promoting kindly feeling between the different sections of our common country and disdaining all opportunity to gain popular applause by abetting partisan strife : saying ever, respectfully and firmly : "Sirs, ye are brethren. The Union is more important than any question of money."

I am glad that such a journal is published near my summer home, that my first reading of the news these lovely mornings is not colored and distorted by sensationalism, hatred, and violent appeals to partisan passions.

One of the most serious of the dangers that threaten our national welfare is the temptation that

presents itself to politicians to express extreme sectional views when selfishly seeking partisan votes. Many also find it easier to call names than to maintain their cause in fair debate. This spring I have visited most of the States, and I am painfully impressed by the bitterness of feeling that abounds, and which, I regret to say, finds such violent expression in New York and in Massachusetts.

I am convinced that our Western fellow-citizens have no more dishonest intent in their protest against the artificial legislative enhancement of the burden of their debts than have our Eastern citizens in their mistaken demand for gold monometallism.

Is it fair to say that the debts have been contracted on the present gold basis when these debts have been generally continuous, because necessarily renewed from time to time in the currency provided by law?

Is it fair to say that the debtors knew of and consented to the demonetization of 1873? How many of the leading business men of the East can assert truthfully that they knew of and understood then the momentous meaning of that act, which was ostensibly an act of 71 sections to regulate details "relative to the mint, assay offices, and coinage, etc." I was a somewhat attentive student of political economics at that time, and I cannot recollect that the importance of that act attracted my attention.

When the question was raised a few years later as to the effect of that act upon the debts of the country, both Senate and House of Representatives passed a concurrent resolution declaring that United States bonds were payable at the option of the government in silver dollars of $412\frac{1}{2}$ grains, and the author of that concurrent resolution was later made a justice of the Supreme Court of the United States. And afterward Congress elected to accept a lower price for bonds, rather than give up this option to pay in silver.¹ Is it quite fair to call our western brethren dishonest for saying what Congress and our leading statesmen and greatest constitutional lawyers and other most eminent authorities have said?

The Bible denounces those who "make the shekel large," and who "make the poor to fail." Lincoln said: "To contract the volume of money before the debt is paid is the most heinous crime," etc.

Blaine said: "The destruction of silver as money and establishing gold as the sole unit of value must have a ruinous effect on all forms of property except those investments which yield a fixed return in money. I believe gold and silver coin to be the money of the Constitution. No power

¹ As stated in the *New York Evening Post* of August 7, 1896: "Yes, the syndicate of February, 1895, offered to lend \$65,000,000 at $3\frac{1}{2}$ per cent. interest if it were payable in coin; or at 3 per cent. if payable in 'gold.' The difference to the government during the time the bonds had to run was over \$16,000,000."

was conferred on Congress to declare either metal should not be money. Congress has, therefore, in my judgment, no power to demonetize either. If, therefore, silver has been demonetized, I am in favor of remonetizing it. If the coinage has been prohibited, I am in favor of having it resumed. I am in favor of having it increased."

Webster said: "I am certainly of opinion that gold and silver at rates fixed by Congress constitute the legal standard of values in this country, and that neither Congress nor any State has authority to establish any other standard or to displace this standard."

McKinley said: "I want the double standard. I would have gold and silver alike."

Hill said: "I am indignant at the rapacity of the gold monometallists, so reckless of both science and of public opinion. The bimetallic coinage is the demand of a vast majority of the American people. No wonder it made us the party of the silver dollar for eight years. To restore it safely, finally, and wisely is the mission of the Democratic party."

Hamilton and Jefferson agreed in saying that the money unit must rest on both metals.

The Democratic National Convention of 1892 declared: "We hold to the use of both gold and silver as the standard money of this country, and to the coinage of both without discrimination against either metal." The Republican National Convention of 1892 demanded "the use of both gold and silver as standard money."

Cleveland said in his letter of acceptance: "With this condition absolutely guaranteed, both gold and silver can be utilized upon equal terms in the adjustment of our currency."

Carlisle said, in the House of Representatives, February 21, 1878¹: ". . . Mankind will be fortunate indeed if the annual production of gold and silver coin shall keep pace with the annual increase of population, commerce, and industry. According to my view of the subject, the conspiracy which seems to have been formed here and in Europe to destroy by legislation and otherwise from three sevenths to one half of the metallic money of the world is the most gigantic crime of this or any other age.

"The consummation of such a scheme would ultimately entail more misery upon the human race than all the wars, pestilences, and famines that ever occurred in the history of the world. The absolute and instantaneous destruction of half the entire movable property of the world, including houses, ships, railroads, and all other appliances for carrying on commerce, while it would be felt more sensibly at the moment, would not produce anything

¹ "On the Senate amendments to the bill (H. R., No. 1093) to authorize the free coinage of the standard silver dollar, and to restore its legal-tender character."

The extracts as here presented have been carefully compared with the official report of this speech, as printed in the *Congressional Record*, Vol. 7., Part 5., Appendix, page 41. Second Session XLVth Congress.

like the prolonged distress and disorganization of society that must inevitably result from the permanent annihilation of one half of the metallic money in the world. With an ample currency, an industrious and frugal people will speedily rebuild their works of internal improvement and repair losses of property, but no amount of industry or economy on the part of the people can create money. When the government creates it or authorizes it, the citizen may acquire it, but he can do nothing more.

"I am in favor of every practicable and constitutional measure that will have a tendency to defeat or retard the perpetration of this great crime, and I am also in favor of every practicable and constitutional measure that will aid us in devising a just and permanent ratio of value between the two metals, so that they may circulate side by side and not alternately drive each other into exile from one country to another. . . . The struggle now going on cannot cease, and ought not to cease, until all the industrial interests of the country are fully and finally emancipated from the heartless domination of syndicates, stock exchanges, and other great combinations of money grabbers in this country and in Europe. . . ."

It would be easy to multiply such quotations. Many of them have been published.

I have steadily opposed the 16-to-1 idea, and have always claimed that the ratio should be regulated by Congress at approximately the market ratio

when both metals should have substantially equal access to the mint. But this question of ratio is quite distinct from the question of constitutional right to have both metals coined at rates regulated by Congress and available as money in payment of debts.

Suppose it were found possible by some new test to distinguish the gold mined in Australia and Africa from all other gold, and that laws should be made in Europe and in America excluding from the mints all Australian and African gold,—would not this be an injustice to debtors on a gold basis? Would it not impair that obligation of the contract which had compelled creditors to accept any gold? Would not Australian and African gold decline to half their former value? Would not all other gold greatly increase in value?

The Constitutional Convention refused to give Congress the right to print paper money, but did give it the right to coin money, and the power to regulate the ratio. It is *ultra vires* for any political convention to attempt to fix the ratio. That duty belongs to Congress. The States agreed to leave the matter of rates or ratio to the arbitration of Congress when they adopted the Constitution. Our present trouble comes from the failure of Congress to alter the ratio on one of those very rare occasions when an alteration was necessary to make the ratio approximately accord with the market ratio, while both metals had free access to our mints.

It would be unfair to take the market ratio for our government now while one of the precious metals is demonetized. But if a reasonable future date were fixed when both metals should be admitted to free coinage at the then market ratio, no wrong would be done to any just interest. Massachusetts used to be proud of being called the silver colony, and strict bullionist views have been held by many of the most enlightened citizens of this commonwealth since it became a State in the Union.

If we will now take the only real sound-money ground—opposition to all credit money,—and patiently and fairly contend for this great principle, that "money must be an equivalent as well as a measure," and that nothing should be money that does not honestly represent labor, the East may yet lead in carrying the country for this great reform of the currency as the East has led in other reform movements.

While most of my interests are in the East, I have interests in the West, and go there every year, and I think I know something of the real feeling there. It is that the East has been more prosperous than the West, and that in so far as this inequality springs from adroit legislation in our favor they intend to have this changed, so that opportunities, so far as law is concerned, shall be made equal, that the government shall not give advantages to manufacturers and bankers that it does not give to farmers and miners. As I have long

pointed out, we are in danger of silver monometallism because we would not listen to reasonable complaints. The East has pushed the pendulum so unfairly toward gold monometallism that it has swung too far the other way.

Let us now do what we can to promote a campaign of education. Let us have a fair debate between the two champions, McKinley and Bryan. They are both thoroughly reputable men, while both the party platforms are faulty. I cannot vote for McKinley for I am opposed to monopoly, but I would claim for him a respectful hearing. Bryan is accused of being young. He may outgrow this fault. Some of us would like to have half his complaint.

ANSON PHELPS STOKES.

LENOX, July 6, 1896.

AFTER THE ELECTION, WHAT?

To the Editor of the "New York Times" :

Whatever the result, we will still have a goodly heritage in the rich land and free institutions of an honest people devoted to the Union and with much real mutual respect between the different sections which are now ignorantly abusing each other.

But the success of either party in the present election will not bring prosperity. If either of the platforms be enacted into law, the industries and business of the people must continue to suffer so long as either gold or silver monometallism is maintained and until we come to use both the precious metals jointly and at about their relative market values, to be regulated when our mints shall be open to both.

The total quantities of gold money and of silver money in the world have been for many years of about equal value at the coinage ratio of about $15\frac{1}{2}$ to 1.

Thus the last report of the Treasury Department, July 1, 1896, estimates in the approximate stocks of money in the principal countries of the world : Gold, \$4,068,800,000 ; silver, \$4,070,500,000. Adding these together, we get a total of, say, \$8,000,000,000 as the world's stock of real money.

But if the value of the silver money be reduced to the present market ratio of the metals, the value of the silver money in the world would be reduced from, say, \$4,000,000,000 to \$2,000,000,000, and the value of the world's stock of real money would be reduced from \$8,000,000,000 to \$6,000,000,000. This gives some idea of the shock which the monetary affairs of the world have received from the demonetization and further threatened demonetization of silver.

Even supposing that the population and trade of the world should cease to increase, and that the present production of gold and silver should be maintained, and that all of it should be coined, it would require seven years to make up this difference of \$2,000,000,000.

The population, however, must increase, and much of the present production of gold is speculative, from mines that sell shares but cannot earn dividends, and a large portion of the product of the precious metals will continue to be used in the arts, so that many times seven years would be required to make up the difference, which can be made up promptly only by the larger coinage use of silver, by which use its market value would be advanced.

It is unfortunate that neither of the great parties in our country has declared for real honest hard money and against all credit money, and it is important that the people should understand this question and know what hurts them when they

find that the proposed Democratic or Republican panacea fails to give relief.

I am opposed to the coinage of silver at 16 to 1. I am opposed to it, not because I believe in gold monometallism. I am equally opposed to that. I believe there is a solution of this whole difficulty which reasonable men in time may come to ; and that is the free coinage, on substantially equal terms, of both gold and silver, in quantities of equal value, at the ratio of their market values. This would work no injury to any just interest.

I would have the silver in new silver standard coins to be equal in weight to the gold in the gold standard coins ; and I would open the mint to the free coinage of both gold and silver when presented together in quantities of equal value of each metal, according to the government ratio of the time, which should be based always on the market ratio, and changed only when the market ratio changed as much as one integer, *e. g.*, from, say, 25 to 1 to 24 to 1, or from 29 to 1 to 30 to 1. The true economic ratio would thus soon be arrived at, and would very seldom change ; and any change would not make recoinage necessary.

I would have a currency so based, half on gold and half on silver, legal tender for the payments of debts contracted after a date some months later than the passage of the act.

The Constitution empowers Congress "to *coin* money, *regulate* the value thereof, and of foreign coin, and *fix* the standard of weights and meas-

ures." These words "coin," "regulate," and "fix" are very significant.

The total exchanges of the Clearing Houses of the United States average nearly \$1,000,000,000 per week ; for the year ending September 30, 1894, they were \$45,028,496,746 ; for the year ending September 30, 1895, \$51,111,591,928.

When we add to this the total amount of transactions that do not go through the Clearing Houses, how ridiculous it appears that we should hesitate to replace with specie our \$346,000,000 of fiat money (greenbacks), so dangerous a menace to all the interests of our country.

The people of this great honest debtor country, when sufficiently educated by history and experience, will find that their safety requires the abolition of all credit money, and they will abolish it when they realize that credit money restricts credit, that every dollar of the miserable, dishonest greenbacks has cost the country an unnecessary loss of many dollars, and that every dollar of credit money destroys many dollars of credits.

As human nature is constituted, no popular government can afford to tamper at all with so insidious and dangerous a stimulant as uncovered paper money.

A Scotch doctor advised his patient to take a little whiskey in hot water. "But," said the patient, "I am a temperance man, and would not like to have it known that I took liquor." "Well, have a bottle of whiskey in your room, and ring for

shaving water." Some days later the doctor called again, and asked the servant how her master was. She replied: "He's better physically, but he's gone clean daft, and shaves himself seven times a day."

Americans are shaving themselves more than seven times a day.

COMMENTS.

BOSTON, May 22, 1894.

. . . I have read your several papers with much interest, and am glad to have them and this new matter in such a convenient and attractive form.

(Signed) FRANCIS A. WALKER.

. . . I have read it with much interest as a + contribution to better knowledge upon the subject of money, a subject, however, which not very many will ever understand nor ever need to, unless they stand in the way of those who do.

Not doubting of the need of the money use of the two precious metals, I am glad to count you on that side.

(Signed) WM. M. EVARTS.

SO. KENSINGTON, 2 June, '94.

. . . It is certainly a much more honest system of bimetallism than the schemes already propounded, but as I disbelieve in any system of international legal tender, and doubt the ordinary meaning given by bimetallists to the appreciation of gold, my mind was not a fertile soil for the seed sown by your book.

(Signed) PLAYFAIR.

TRINITY COLLEGE, DUBLIN, June 2.

. . . The state of the case is that here every thinker is in favor of bimetallism of some sort, every business man against it. The latter will go on jeering at the former for a generation and then will find out that the Professors were right. That is the usual course of history. . . .

(Signed) H. MAHAFFY.

LENOX, MASS., May 22, '94.

. . . It seems to me that you have very cleverly laid at rest *mono* and *bi*, and introduced a flexible *nexus* which unites the two precious metals so that without injury to either they can together make a permanent currency basis. . . .

(Signed) RICHARD GOODMAN.

N. Y. TIMES, May 26, 1894.

. . . A rather striking example of the deep interest which thoughtful men and men of large affairs are now taking in one of the foremost questions of our times.

15 LOMBARD STREET, 1 June, '94.

. . . I quite agree with you that the so-called Bimetallism is not really Bimetallism. I fear, however, that there are fatal objections to the purpose of allowing an official to determine the value of the silver coins from time to time.

(Signed) JOHN LUBBOCK.

THE CHELSEA, June 10, '94.

. . . Your suggestion is a valuable contribution to economic thought, and it looks to me as if your idea, carried into practice, would solve the problem of currency.

(Signed) DANIEL GREANLEAF THOMPSON.

June 11, 1894.

. . . I am not wise in the matter of methods, and only an expert would be competent to pass a valuable judgment on the details of your plan. But I thoroughly agree with you that our hard times are due to the attempt to put the business of the world on a gold basis, and that we shall not have any permanent return of prosperity until, in some form or other, we succeed in establishing a standard of currency which will neither appreciate, as gold alone is certain to do, nor depreciate, as silver alone is certain to do. . . .

(Signed) LYMAN ABBOTT.

MARKET DRAYTON, 14 June, 1894.

. . . Indian difficulties must, however, force the silver question upon us before long, and then your ingenious proposal may be a great help towards solving the problem. Some of our leading men, including Mr. Balfour, are much disposed to agree with your view. . . .

(Signed) FRAS. R. TREMLow.

SPRINGFIELD REPUBLICAN, June 16, '94.

. . . But behind this movement there is a real element of popular sagacity, which finds honest expression in the silent rather than the outspoken desire of many millions not to give up silver as a part of the world's stock of money. Mr. Stokes of New York, who is neither a Republican nor a Populist, nor a crank of any class, recognized this silent preponderation of public sentiment some months ago, and began to print in the New York newspapers some letters on "Joint-Metallism," which attracted attention . . . and thus carried on the discussion with good temper and in a style where pleasant humor is mingled with forcible suggestion, and a candor which no infallibility from the Delphic Oracle to the New York weeklies can be expected to indulge the world with. The merits of Mr. Stokes's plan will be sufficiently discussed before Congress adopts it,—but it has real merits, and contains the element of a just appreciation of the present world difficulty,—which neither Reed nor Lodge nor Harrison even seek to express, and apparently do not see. . . .

DOWANHILL GARDENS, GLASGOW, 19 June, 1894.

. . . It is a most suggestive contribution to a subject which is now creating as much interest in Great Britain as it does in its parent country. . . .

(Signed) W. SMART.

N. Y. COMMERCIAL ADVERTISER, July 23, 1894.

. . . There is much ingenuity in his plan and his supporting argument.

ROCHESTER CHRONICLE, June 26.

. . . The book is well and intelligently written, and has some novel ideas. As a contribution to the literature of a subject of world-wide interest it is well worth reading. . . .

INDIANAPOLIS JOURNAL, July 27, 1894.

. . . The book is an interesting contribution to the currency question.

August 3, 1894.

I have read your book on the silver question with very great interest. . . .

(Signed) C. SCHURZ.

South Eagremont, Aug. 16, 1894.

. . . It occurred to me, on looking at your book when it was first issued, that its citations looked inviting, and that probably your own part was better than the citations, so I bought it. I have it here on my vacation. I think you have performed a very useful and distinct public service; you have presented a plan the most practical of anything I have seen suggested for the solution of a question, beset, from whatever point we regard it, with obvious difficulties. . . . You have answered *all* the criticisms, and your citations admirably back you up. The book is one that I shall put with those that I most frequently have occasion to refer to on subjects of national interest. . . .

(Signed) GEO. R. BISHOP.

CONCORD, December 11, 1894.

"Joint-Metallism" is charming. . . . As in his first edition, now much enlarged, Mr. Stokes shows good humor, good sense, and a competent knowledge of his subject. . . .

(Signed) F. B. SANBORN.

LEICESTER, MASS., December 16, 1894.

. . . The importance of the question you so ably discuss cannot be overestimated.

(Signed) JOHN E. RUSSELL.

133 East 35th Street, NEW YORK, December 17, 1894.

. . . The matter of "Joint-Metallism" is one which I have, for a long time, been desirous of making a study of ; it enters as so large a factor into serious current questions that a man who professes to know anything about his day and country ought to have at least a degree of information respecting it.

(Signed) C. H. PARKHURST.

DEPARTMENT OF THE INTERIOR,
BUREAU OF EDUCATION,

WASHINGTON, December 19, 1894.

. . . Your valuable book on the subject of "Joint-Metallism," in my humble opinion, is the best book on this subject—a subject of vital importance to the prosperity of the people of this country.

(Signed) W. T. HARRIS,
Commissioner.

SPRINGFIELD REPUBLICAN, Jan'y 22, 1895.

It often happens that when two opposites have battled against each other for years, a middle term, or peaceful union, is at last found, by which the fierce strife is composed. Thus was the long war of the red rose and the white, in England, brought to an end by the marriage of the white rose of York to the Lancastrian but unblushing Henry Tudor. At present the battle of the standards—on one side gold, on the other silver—is raging savagely, like the quadrilateral puss-in-the-corner of Milton's chaos :

For hot, cold, moist, and dry, four champions fierce,
Strive there for mastery, and to battle bring
Their embryon atoms ; Chaos umpire sits,
And by decision more embroils the fray.

Far be it from us to compare Anson Phelps Stokes of New York to Satan,—though, if he goes on pestering the souls of the infallible in New York and London, somebody will give him as ill a name,—but really, his attitude before he began to

print essays on "Joint-metallism" was a little Satanic, if Milton is a correct reporter :

Into this wild abyss the wary fiend
Stood on the brink of Sheol—and look'd awhile,
Pondering his voyage.

At last an intuition came to him, and he saw that the way to umpire this awful game of financial football was to marry the two precious metals in one act of exchange, so that, instead of monometallism or bimetallism, the world should rejoice in "joint-metallism." And what is that? . . . He proposes to admit gold and silver freely to the mint, if presented in quantities of equal value (according to a government ratio fixed from time to time)—the silver coin to have the same weight as the gold one, but, of course, to be much less valuable. Then make one gold coin, plus as many of the silver coins as will equal it in value, legal tender to twice the value of the gold coin, for all debts contracted after a fixed date. Next let the United States receive these twofold coins, when offered in equal values of each metal, and issue against this deposit "joint legal-tender currency certificates," payable half in gold and half in the new silver coinage,—the government fixing the ratio of one metal to the other. . . . If all men were as well-informed and fair-minded as he, "joint-metallism" could be introduced this winter, and would probably work well.

BOSTON GAZETTE, Dec. 29, 1894.

. . . The favor which attended the earlier edition of this work will no doubt be extended to this fuller and more comprehensive consideration of the same subject. The ideas are presented in a fresh and lucid manner that will attract the interest of thoughtful people.

KANSAS CITY TIMES, Jan'y 28, 1895.

"*Joint-Metallism*," a work by Anson Phelps Stokes, is especially valuable now while the currency question is being discussed both in and out of Congress. . . . It is undoubtedly a book to interest students of political economy. . . .

KANSAS CITY JOURNAL, Jan'y 28, 1895.

The work is a profitable study of the great and all-absorbing question of the present time, and from a standpoint calculated to do much good.

ROCHESTER HERALD, Jan'y 5, 1895.

. . . Perhaps one of the most valuable monographs on the monetary question now available. In view of the intense interest the subject has for every resident of this country, the publication is timely.

UNITED STATES SENATE,
WASHINGTON, D.C., Dec. 8, 1894.

. . . I have read the book with very great interest and pleasure, and shall very carefully and patiently study your plan. It seems to me to be worthy of the most thoughtful consideration. . . . (Signed)

JAMES K. JONES.

DEPARTMENT OF LABOR,
WASHINGTON, D.C., Jan'y 2, 1895.

. . . I have taken much pleasure in perusing it. . . . Your theory attracts me very much. It seems to me that there is within it the solution of the difficulty. . . .

(Signed) CARROLL D. WRIGHT.

DETROIT JOURNAL, Dec. 20, 1894.

. . . Mr. Stokes's plan is novel, and his arguments to support it are at all times interesting and impressive.

BALTIMORE AMERICAN, Jan'y 2, 1895.

. . . This is a subject of intense interest at the present time, and any method by which the relative values may be maintained is of great importance to every citizen. In this volume much information of great value may be obtained.

BOSTON TIMES, Jan'y 6, 1895.

. . . The book is a valuable contribution to our financial literature. . . .

LONDON PUBLIC OPINION, Dec. 7, 1894.

. . . . This plan . . . Mr. Stokes sets forth with much lucidity. . . . Mr. Stokes is quite right when he asserts that the great difficulty of solving the question of the metallic basis of currency comes from inadequate study. . . .

PITTSBURG GAZETTE, March 1, 1894.

Mr. Anson Phelps Stokes has formulated a practical plan for securing the joint circulation of gold and silver. Mr. Stokes's plan certainly has the merit of originality, and it seems to overcome the chief difficulties heretofore found in securing the joint use of the two metals.

LAWYER AND CREDITMAN, April, 1895.

The historical portions of the work are superior to anything we have seen for conciseness and exhaustive reference to the best authorities both on the gold and double-standard side of the question.

BURLINGTON HAWK-EYE, June 30, 1895.

The plan is thoroughly explained, and every student of the financial situation will find in it an inviting argument.

FROM THE PRESIDENT OF THE AMERICAN SOCIAL SCIENCE
ASSOCIATION.

WATERBURY, CONN., Aug. 1, 1895.

I bought *Joint-Metallism* last winter and laid it on my desk, and I have only found time to read it within the last two or three weeks. I have been interested and instructed by it.

You have contrived to get a great deal of clearly expressed thought into a moderate compass. It seems to me that your plan would introduce silver again into the money of the world without serious disturbance—especially if some time, say a year, was given after the passage of the act and before it went into operation.

Meantime silver would gradually advance to about its proper point, that is it would get the principal part of the effect of restoration.

It seems to me that you still leave gold the measure of value, and this, I think, must be done.

The effect of the plan seems to me just about equivalent to doubling the amount of gold which goes into use as money.

I think you have reason to be much pleased with the success of the book.

(Signed)

FREDERICK J. KINGSBURY.
